-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No monitoring

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Robert Flynn

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is a demand for commercial practices as ISPs get to manage networks out of commercialism rather than effective management. For example, zero-rating allows customers to use provider-selected content sources or data services like an app store, without worrying about bill shocks, which could otherwise occur if the same data was normally charged according to their data plans and volume caps. This has especially become an option to market 4G networks, but has also been used in the past for SMS or other content services.

These practices are criticized as anti-competitive and limiting open markets. It enables internet providers to gain significant advantage in the promotion of in-house services over competing independent companies, especially in data-heavy markets like video-streaming. A service provider, who is offering unlimited access to his service, will naturally seem more favorable to consumers over one where usage is limited. If the first provider is the one restricting access, he is creating a considerable advantage for himself over his competition, thereby restricting the freedom of the market.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services can help ISPs direct traffic flow based on several factors. They allow Internet traffic to flow without clogging up traffic to a majority of websites and online services. Yet its fast lanes serves as a detriment to the Open Internet. The online economy is an ever-dynamic landscape with a lot of innovative and fresh enterprises and personalities. Changes range from a level playing field to a manipulated one in which only a few entities or individuals that demand a fee from new players to be able to compete by offering services. Thus, having monopolies on the Internet does not promote economic progress, but it hinders it.

Is there a demand for specialised services? Which services should be allowed this special treatment?

The demand comes from corporations and ISPs who wanted to have a competitive over their rivals. No service should be given priority over another because it restricts content flow, which constitutes online favoritism.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The Internet is not just web traffic. There is video chat, BitTorrent, games (e.g., Minecraft), and privacy tools that encrypt your traffic like VPNs and TOR. Good Internet providers try to make all of these services work as best they can, but the new EU rules would let Internet providers be lazy—or evil—and throttle traffic they do not care about, or do not like, even when there is no need to. That is a serious problem, for any app that goes beyond the web, whether it is to protect privacy, let people communicate directly, or make the internet more decentralized and independent. Internet components like video chat, games, and Bitcoin are all at risk. Thus, ISPs should not be allowed to monitor any web traffic to a point where arbitrary slowdowns occur.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not interfere with any Internet connection completely if its aim is to degrade the Internet or restricting access certain websites and certain types of web traffic. The network's primary job is to move data—not to choose which data to privilege with higher quality service.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would to receive every piece of information that ISPs can give to me about my Internet connection. Information included, but not limited to, includes speed, quality of service, and the method of traffic management. Transparency cannot manifest in the Open Internet without revealing every bit of information possible to help ISPs and Internet users to make informed decisions.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The potential is so monumental that it is hard to envision what the future will bring. But the potential itself should be there for hypothetical community to make the best of it and only internet neutrality guarantees that.

Is there a demand for specialised services? Which services should be allowed this special treatment? There is not. The majority of the (unmanipulated and knowledgeable) user community is against any special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Traffic management hinders freedom, hinders user's experience and therefore further community's development. It also opens doors to shady practices.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It should not. This totalitarian move will eventually not only get fraudulent, but also hinder the community's efforts, user's experience and the internet's potential.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

\* Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user?

Zero rating does not imply that the bandwidth is actually sufficient for the job anyway. Moreover, the entire concept of limiting bandwidth by using quotas is primitive, inefficient, and not used at all in many places. I am not in favour of internet connections that preference certain content providers over others, without the user having any real choice in the matter. It would be better for users to have subscription services provided gratis, than to bias network connections.

\* What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Preferential treatment of traffic from given sites will suppress creativity and content, in favour of the corporates who pay extra for their ads to look important. It is understandable to have subscription services, where paying for preferential access to services might be possible, but it is not appropriate to apply this in general to all internet traffic. This would grant corporate internet services to unfairly profit from the hard work of others by being given preferential treatment. Unless they actually BUILT the network, including wires, cables, connections, nodes, satellites and wireless transmitters, then it's not theirs to monopolise.

\* Is there a demand for specialised services? Which services should be allowed this special treatment?

Streaming video and music would be the only genuine application I can foresee, and it's questionable if they should be given better access than equivalent providers. The network is not theirs to buy or sell.

\* Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO. Interference and examination of my internet traffic is a violation of my right to privacy, and has the potential to compromise my financial security too. Political interference and persecution of minorities are also possible if you allow packet inspection. I have absolutely no faith in private corporations to treat data privacy ethically.

\* How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should adhere to the service guarantee they provide when I signed up, or I would seek legal compensation. Throttling of non-preferred sites is not part of their service provisions, and would be a violation of contract. In general, although ISPs can offer whatever services they think they can sell, I will exclusively favour those who do not preference or throttle any networks, as I do not wish to be ushered under the umbrella of some corporate monolith. Traffic should be anonymous and impartial, with the exception of deliberately disruptive massive traffic (ie Flooding, DDOS, etc).

\* What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Comparative tables would be most meaningful - comparison with network mean response times, and that of these 'optimised tunnels'. All the values that might be measured can only be made meaningful by comparison with other samples and situations.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
nein.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Die Ermöglichung von Spezialdiensten führt zur Beschränkung von allem Anderen, was nicht Spezialdienst ist. Wer so etwas wirklich braucht, kann sich eine Standleitung mieten.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
nein. Keine.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Es sollte nicht nur eine "bis zu" Bandbreite angegeben sein, sondern auch eine garantierte.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Dietmar Kruse

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

there is no positive impact for specialised services

Is there a demand for specialised services? Which services should be allowed this special treatment?

yes but it shouldn't be allowed

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of the above

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
larry hertz

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only demand I can see is from the "commercial practitioners" looking to monetize their control.

Is there a demand for specialised services? Which services should be allowed this special treatment? The only demand I can guess at is that from the providers of the services who see the potential of making extra money.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

This is a gross invasion of privacy for purely commercial gain by providers using the information collected - either by the providers or third parties.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no interference with private internet connections

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I get reasonable information on my internet connection from my current provider.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I need upload power, and cannot get it some SLOOOW lane trap.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Without 100% freedom of the net, we all lose our right to choose, and must submit to another's ethical dilemma rather than our own.

Is there a demand for specialised services? Which services should be allowed this special treatment?

NONE

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE. They should govern their own house and let everyone else control theirs.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Der Bedarf ist für mich nicht erkennbar! In letzter Konsequenz führt er zu einer Diskriminierung kommerziell weniger verwertbarer Dienste! Ich zahle monatlich bereits ordentlich für eine Flatrate und sehe nicht ein an anderen Stellen weiter abgezockt zu werden.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Positive Einflüsse sind für mich als Endverbraucher nicht erkennbar. Ich sehe ausschließlich nachteilige Verzerrungen und die Entstehung eines Zwei-Klassen-Internets!

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine! Sie verhindern den bedarfsgerechten Ausbau der Übertragungskapazitäten. Dies wird zu einer deutlichen Verschlechterung der Qualität der Übertragungsgeschwindigkeiten insgesamt führen!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Auf keinen Fall! Ich verbitte mir jegliches Ausschnüffeln und die Verletzung meiner Privatspähre sowie meiner Persönlichkeitsrechte!! Pfui!!!

1984 ist Geschichte - Willkommen im Skynet!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht! Schließlich zahle ich bereits für einen diskriminierungsfreien Zugang!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Alle!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Henry Tünte

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Specialised services should only be allowed if the consumer chooses them, and should not be allowed to replace or reduce the quality of access to existing Internet services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
Specialised services ensure that entrenched sites remain the most popular and new offerings can't compete. This encourages monopolistic tendencies and decimates innovation and competition.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices that change the way I access the Internet or make some services or website outperform others or not desired and greatly diminish the value of the service I am paying for as an end user.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISPs should not be able to prioritize my traffic unless I get to choose the priorities.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Yes, as long as no content is retained.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Minimum and maximum bandwidth, latency, any traffic shaping including port-based and deep-packet inspection, any caching behaviors, any interference with DNS such as replacing failed DNS lookups with ads or redirects. Any traffic that will be blocked or cause my internet connection to be blocked.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Justin Rohrer

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there isn't. We can empower users to throttle their services themselves. This could quickly become a tool for censorship and crony profit practices by making information requested practically inaccessible and giving power to ISPs to charge more for highly demanded services which are currently accessible.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Cost of deploying new services - specially those which have low latency and high bandwidth requirements - would go up, making it harder to enter the market. Similar initiatives without profit motive will suffer even more.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None that I can think of. Consumers buy bandwidth for any service. If consumers are demanding priority of bandwidth for a certain service, empower them with tools to allocate their bandwidth as they desire. There's no reason for ISPs and internet companies to decide for consumers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Never. This is unnecessary to me and an invasion of my privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not all. I can do so at my own discretion.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of that. I would also like to be alerted when my connection is being throttled.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? There may be a demand, but not from the end user. Commercial interests shouldn't interfere with the functionality of the internet.

The ISP should not be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

My ISP should not be able to interfere with my Internet connection - for example to throttle or prioritise certain types of online traffic (video, P2P, etc).

All information pertinent to the quality of my internet service should be available to me.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. ---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not sure.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would discourage innovation and openness. The only positive would be for internet providers and companies in the "fast lane".

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
S B

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein. Solche Praktiken wie z. B. Zero-Rating beschränken die Benutzer bei der Verbreitung von Inhalten und schränken die freie Auswahl von Inhalten ein. Eigene Inhalte der Provider wie z. B. MobileTV der Deutschen Telekom erhalten durch Zero Rating unzulässige Marktvorteile gegenüber anderen Inhalteanbietern.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht. Mein Provider soll alle Datenpakete gleich behandeln unabhängig von Sender und Empfänger und Art der Pakete und der erzeugenden Anwendung.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Provider müssen in Verträgen leicht lesbare, vergleichbare technische Daten zum Internetanschluss geben, anhand derer man die Quality-of-Service von Anwendungen bewerten kann (max., min., durchschnittliche Übertragungsrates, Latenzen, ...)

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Werner Behnke

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Denis Hanlon

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. None.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract.

Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Für sicherheitsrelevante Dienste könnte es Sonderregelungen geben.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
garnicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Quality-of-Service

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für

Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, but I agree with the FCCs view in the US that it is equivalent to an 800 number.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Who can really say what the positive and/or negative impacts would be? There will be things happening in the future that we can't even imagine right now.

Is there a demand for specialised services? Which services should be allowed this special treatment? Emergency services could benefit, but I believe those should be set up on a separate network entirely to keep them from experiencing the issues that any network as inclusive as the public Internet is bound to experience.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This would be a direct invasion of privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference should be done by an ISP based on content of the network traffic. Overall connection speed and total bandwidth should be the only control an ISP has.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Michael Elkevizth

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

Is there a demand for specialised services? Which services should be allowed this special treatment?

no

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

speed, quality of service, competitive pricing

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If my ISP made Google Play Music zero rating, when I use Spotify that would encourage me to pay for Google Play Music so I wouldn't have to pay for extra data. As Spotify is a smaller business they would lose a lot of business and potentially have to downsize or go under leaving everyone with one less choice for this service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No it invades privacy

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, all data is equal

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Any information I can get my hands on

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? There could be a demand for quick data transfers – maybe for hospitals and healthcare issues or self driving cars. However, these services should never be routed through the common internet. No one wants a loading animation during an heart-operation or while driving with 150km/h on the highway.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not. No one should be allowed to monitor my traffic, especially not the contents of my traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should never be any interference. Any data-packet should be treated equally.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. ---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No one I have met has ever shown any interest in commercial practices such as zero-rating. I would find such a practice truly appalling because it would infringe on my rights as an end-user. With zero-rating in effect ISP's would have the power to basically stomp out any sort of competition or business that does not support them. As an example, let us say ISP X is allowed to practice zero-rating, then two companies offering similar services start up online. Some consumers will prefer company A and some will prefer company B. Then company A makes a deal with ISP X to be apart of it's zero rating plan, while company B continues on as before. As soon as the zero rating comes into effect all new business will instantly flock to company A because it is more cost effective, stomping out Company B and leaving all those who prefer it to company A with No Choice as to what service they will use. It is that kind of eradication of choice that will happen on a massive scale if ISP's are allowed to use these "commercial practices". That is why it must not be allowed to happen.

Is there a demand for specialised services? Which services should be allowed this special treatment? I have seen no demand for these specialized services and none of them should be allowed because they will compromise the freedom of the consumers and the internet itself.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

According to the ISP's the positive effects of specialized services are companies who are willing to pay more will have easier access to consumers of the goods or services. That is not so bad except, it also gives the ISP's power to, effectively, slow down any business that is not willing or able to pay the price of a special service. This would have many negative effects on the consumers rights and also on small businesses that are just getting their start online. Many ISP's have often claimed they would never practice such behaviors, but one only needs to look at the customer approval rating of most of these companies to see how little they care about how their practice effect their customers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive any and all information I can about how my internet service is provided and managed, spare no detail I am quite willing to read it myself.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No,they should not, because they would use that information without my consent.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should have no say in where or how I use the services they provide. I am giving them the money they ask for and in exchange I should be allowed to use the service as I see fit, with no tampering on their part.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
David Shingles

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

when commercial interests are given preference, it hurts the public.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

unknown

Is there a demand for specialised services? Which services should be allowed this special treatment?

unknown

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

IPS should not be able to vary the internet connection.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

very heavy users should be assessed for "excessive" use; a standard of (say, 15 X average user's use) should be created. IN NO EVENT SHOULD CONTENT EVER BE MONITORED.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Jonathan Hartman

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Max Maaß

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\* Specialized Services should only be allowed for services that cannot reasonably use the regular internet. They should explicitly NOT be allowed for existing services on the internet, like streaming.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\* If a reclassification of existing internet services like streaming to specialized services were allowed, this would be the end of net neutrality and the open internet. Specialized services that cannot reasonably use the normal internet, like high-availability connection for critical health applications, may have a positive impact, however I do not yet see any need for them.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\* Zero-Rating is a form of positive discrimination. In Germany, the Telekom has an exclusive deal with Spotify to exclude Spotify traffic from the regular quota on mobile phones. This leads to a direct disadvantage for Spotify's competitors and may shape the decision of end users as to which music service they will be using. This form of discrimination should be forbidden.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No. There is no reasonable case in which DPI would be positive, but it has great potential for security and privacy problems.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\* The ISP should be legally required to treat all traffic equally.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I'd like to be able to request all information relevant to my connection

- the speed, QoS (especially traffic management strategies if they are still allowed), and information on what data is retained about it on the ISPs end.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Ich sehe keinen Bedarf für Spezialdienste!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
überhaupt nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Ich erwarte klare und verständliche Informationen und Aussagen zur Qualität des Services und zur Geschwindigkeit. Bei der Leistung ist es wichtig, dass diese für mich als Benutzer qualitativ hochwertig ist, sodass keine Störgeräusche oder Verzerrungen auftreten.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen

Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Hannelore Feicht

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No demand, it could limit my rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Only benefit for big corporations which is not the purpose of society and was never a goal of human evolution. History will remember.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I don't allow to interfere at all!!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

How my traffic is managed!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

People should be able to make up their own mind on what services to use on the internet. Zero-rating is an unacceptable disenfranchisement of users

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can't think of an scenario where such specialised services would be really necessary

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't see any convincing use cases for such services

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating is a component and tool for discriminatory operation.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

'Specialised Services' can readily become a tool of discriminatory practice. Unless there is very clear-cut definition and limitation on them.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Only non Internet services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Intrusive inspection is wrong. Counter to privacy and if formally approved, invites the corporate tendency to misuse.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only in so far as contract allows.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

EDRi 10 Points to Safeguard Net Neutrality - with effective power via a govt. appointed authority.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. ---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I believe the only demand for specialised services is being artificially created by service providers in order to manipulate consumers into a position where they have to pay more for less service.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Paid Internet fast lanes would be disastrous for development and innovation as this essentially "prices out" all smaller developers and innovators. This allows large corporations free reign over the internet and freedom to control their own interests and prioritise theirs above all others.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The commercial side of zero rating is already being used to devastating effect with 3rd party video services being restricted and a provider's own service is allowed to transmit at full speed. This is basically ransoming a service which should work perfectly under normal conditions.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Very little, and only to ensure time sensitive traffic, such as VOIP, are able to run without interference.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I believe that an ISP should provide regular updates on it's network and perhaps notifications stating your average speed for the month/quarter and compare that to the national average/available speed for the user's geographical area.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Yes, but only in extenuating circumstances such as network preservation. For example: Torrent traffic eating into a network and using all the available bandwidth whilst time sensitive traffic such as streaming takes a hit.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. ISPs should remain neutral and treat their work as an international trust.....

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Marilyn Sutton Loos

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Manipulation von Information aus kommerziellen oder auch politischen Gründen. Ausbau von Hierarchien und Machtstrukturen für finanziell oder politisch einflussreiche Strömungen.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Öffentlich rechtliche Medien (Fernsehen und Rundfunk)

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, natürlich nicht!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Karin Oesten

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices such as zero-rating would definitely limit my rights in using the internet. It would limit what I could send and receive online and how often I could do that. It might completely stop me from using the internet for certain functions. For people who now can barely afford to be online, it would definitely stop them dead from using anything that costs more. That completely limits those people's access and their use of the internet. Many, if not most, of such people are people of color, poor people and often rural people. Since more and more the internet is THE primary instrument of communication--and particularly communication with Government that often will ONLY communicate online--limiting such people's use of the internet with these restricting commercial practices is clearly discriminatory. People of color and poor people in this country WILL be disparately impacted by such practices.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see no positive impacts for the public from specialized services. The only positive impacts of such "services" would be increased profits for the providers. We have a wonderful thing in the free and open internet now but some greedy people just want to squeeze "all that the traffic can bear" from the end-users and destroy this wonderful gift that has been created. I see only negative effects from this for the public and for the growth and development of the internet in the future. And, as I mentioned before, these negative effects will hit the poor and people of color the most so "specialized services" are definitely discriminatory. Do we want free inquiry and greater communication worldwide, an increase in equality and freedom, or do we want to throw it all away so a very few already rich people and companies can get richer?

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Never. Especially they shouldn't be able to see my content. Privacy is very important to me and having commercial institutions reading my content is every bit as bad as having the NSA or the government doing it.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP shouldn't interfere at all with my connection. They should provide a service that is the same for everyone and for all types of media. If some things, like video, cost them more, they should include that calculation in what they charge me for the whole service. Adding additional service costs either to the sender or the receiver for this and that, or giving people slower or bad service if they don't pay extra is an incredibly bad idea.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I really have only received information on speed as I find the language about the rest to be highly technical and confusing. It would be great to have contracts include this information in easily understood language.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The new EU rules would let Internet providers be lazy—or evil—and throttle traffic they don't care about, or don't like, even when there's no need to.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

A subtlety in the rules would let ISPs offer "specialized services" in a fastlane that would cannibalize bandwidth for other services. We need to make sure that if an ISP offers a specialized service (like television), that bandwidth is in \*addition\* to whatever else people have. Otherwise it's a fastlane.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There's no demand from me. It is hard enough to find a real choice of content and services already because of the large player on the internet such as Google and Amazon. I have already started using real shops in preference to online ones because of limited options on many search engines. What use are sites in the US to me, a resident of UK?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Smaller more exciting innovators will be put off. Prioritising large corporate providers will just stultify innovation that goes beyond current thinking.

Is there a demand for specialised services? Which services should be allowed this special treatment? There may be some specialised service demand but they should not receive preferential treatment as this would lead to a very narrow internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not at all. This would limit choice

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all I could not run my business efficiently if connections were slowed. Communication with others would be almost impossible.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

This kind of info would, for example give one an idea of why there is a jerky connection sometimes. It would enable one to know whether hardware is at fault

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
On no way.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
In no way.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Speed only.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Jens Haufe

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. If that is done, then our right to privacy will be violated.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Alejandra R. A.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

My right to choose what I do and use on the internet should not be impacted zero rated services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The negative impact on freedom of information flow and on political dialogue are obvious.

Is there a demand for specialised services? Which services should be allowed this special treatment? not sure if any should be, but it should be regulated and not left up to for profit providers alone to decide.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All, especially true speeds since we seem to be charged but have no reliable verification if we are receiving what we pay for.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Patrice Curedale

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Franz Gratzner  
Verein Gegen Tierfabriken (VGT)

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No.

Leaving behind net neutrality would harm those who challenge institutions in power and who do not have enough funding to pay for fast lanes. Therefore specialised services would seriously damage democratic liberties on the world wide web.

If only some sources are exempt from traffic rating those services automatically will become preferred sources for users. This way zero-rating would undermine equality and fair conditions for all content providers. Inequality would be enforced by granting or denying zero-rating.

If possible, data that could be harmful if shared to the wrong entities, should not be collected in the first place. This ensures such data can not be abused.

ISPs are private service providers. It is not their task to regulate citizen behaviour. ISPs are no government or law enforcement agencies.

They are not instated by democratic processes and shouldn't exercise such powers.

The best way to express internet speed information would probably be with standardised usage test results, directly comparable over different providers. Much like graphic performance tests for computer systems in magazines. There could even be an absolute final value with growing numbers as connectivity technologies evolve. Maybe split down in different numbers for average speed, lowest speed, maximum speed and reliability (maybe even supplied for different time frames like during office hours, in the evening, in the morning or at night).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Franz Gratzner

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There's a commercial demand for these practices, meaning businesses want to implement them. Charging content providers extra strangles new ventures and will inevitably increase my costs as a user. No business pays increased fees they pass it along to their customers

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Negatives were covered in the last answer, namely increased barrier of entry for new ventures and solidifying access and power in the hands of those already on top. Is it possible that by having less competition exposing providers have more resources to develop new and better services? I suppose, but history shows that extra capital ends up in pockets and not in R&D

Is there a demand for specialised services? Which services should be allowed this special treatment?

Covered already. I can't imagine any content provider is eager to pay more for access to what should be considered a utility, but there are already numerous examples of ISPs looking for ways to charge more for access to said utility

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. I don't want the postal service looking through my mail for "traffic management", nor do I want ISPs doing the same

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Ideally none. Internet is a utility at this point, access should be unfettered

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely NOT!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
I don't know.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All of the above.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any commercial practices which limit user’s rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation

Is there a demand for specialised services? Which services should be allowed this special treatment? not that i know of

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

there arent really any positives to specialized services especially if they are offered as substitutes for internet access.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all is very important to the consumer, business or otherwise

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

they shouldnt be able to at all

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
steven goldman

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I do not know.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I do not know.

Is there a demand for specialised services? Which services should be allowed this special treatment? Perhaps in certain cases, but only in very special circumstances.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not if there are reasonable alternatives.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

As little as possible.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know that people were not unfairly limiting my access to websites of my choice.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No to "zero." I need alternative news sources which are money-limited. I need communications for volunteer action, by definition non-commercial.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
NO!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No Geez I pay an arm and a leg for slow service.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All transparent and easily available.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-Rating ist nur ein Mittel, um vorhandene Marktmacht zu festigen. Es steht der Innovation entgegen, indem es Einstiegs-Hürden aufbaut, sowohl für neue Anbieter als auch für den Endverbraucher, der sich auf neue Anbieter einlassen möchte.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Jegliche Sonderregelungen und "Spezial"-Dienste o.ä. machen die Arbeit für den Verbraucher nur aufwändiger und undurchschaubarer.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Keine. Es gibt einen Bedarf für Netzausbau. Wenn dabei jedes mal überlegt wird, welcher Dienst gerade rechnerisch eigentlich noch durchkommen müsste und welcher nicht, verzögert das nur unnötig, anstatt das Problem zu lösen, wenn die Flussbreite nicht ausreicht und sich das (auf welche Art und Weise auch immer) bemerkbar macht.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, das würde den Datenschutz zu sehr zurückdrängen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Gar nicht. Alle Datenübertragungen müssen gleich behandelt werden, alles andere fördert nur sinnlose Umgehungsstrategien und lenkt von der Hauptaufgabe ab, das Netz allgemein auszubauen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Es muss ausreichen, die Geschwindigkeit zu kennen und dass diese Angabe realistisch ist. Alles weitere sollte für den Endverbraucher (wie mich) keine Rolle spielen - er braucht die Zeit, um sich auf die Nutzung und Inhalte zu konzentrieren, nicht auf die technischen Hintergründe. Der Gesetzgeber sollte dies durch möglichst einfache und klare Vorgaben ermöglichen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Matthias Lange

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Michael John Cross

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

THEY CAN INFLUENCE WHAT I SEE OR SEE ONLY WHAT THEY WANT ME TO SEE.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It will slow or even stop new services or business and will stop access to free flow of information to all users

Is there a demand for specialised services? Which services should be allowed this special treatment?

All services should be treated equally

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO, that gives the ISP access to complaints against them and they can then have the ability to stop delivery

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All that has an effect on my access and my ability to free and unfiltered information

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I think you said it best, "Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation."

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I think its pretty easy, to see that this could have a discriminatory effect on small businesses & individuals, who cannot afford to pay for fast access to the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I don't think any service should have special treatment

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Hell No....

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
It seems we already pay to get online, I don't think its reasonable to have to pay twice...

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
You should be able to find out the speed of connection, quality of service...etc.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every

enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Anthony McMillan

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
The emergency services only (fire, medical, police, coast guard).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
A specialised service could help for contacting the emergency services - otherwise, they should not be used to divert traffic towards one site or another.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Very little.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
How much of my speed is lost due to external management.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Nicht finanzstarke Privatpersonen und Firmen / Organisationen werden benachteiligt.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
keine

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
alle Informationen leicht verständlich

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
überhaupt nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte.

Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Erdmuthe Farthofer

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"specialised services" which would allow a discriminatory "fast lane" for services will protect big providers from competition from inovatives newcomers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! Never!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to interfere with my Internet connection - for example to throttling or prioritise certain types of online traffic.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

It would be normal to get standardised information about the quality of the service provided. In order to follow its evolution and to compare providers.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Laurent GATEL

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not sure.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Some have a priority and are able to improve their product at a substantially faster rate than others who can't afford it.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
not sure

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None, Mine is slow enough as it is.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Yes, all of the above. But if they told me that, and my service sucked, I might go elsewhere

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, individual monitoring - even for the purpose of managing traffic - is a dramatic overreach of government oversight on individual thought, practice, and assembly.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not. Restricting my access to certain kinds of online traffic restricts communication and freedom of thought.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Christopher Wayne Buckley

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich verlange: Die technisch verfügbaren Datenbandbreiten eines Internetproviders sind auf alle zeitgleichen Nutzer in gleichen Anteilen zuzuteilen. Absolut unabhängig vom Dateninhalt oder Verbindungstyp. Einzige Ausnahme dabei ist nur eine Limitierung bei Erreichen einer eventuell vertraglich vereinbarten maximalen Bandbreite.

Es ist unter allen Umständen auszuschließen, dass die Nutzung bestimmter Internetdienste durch Nutzer A, die verfügbare Internetbandbreite oder bestimmte Internetdienste von Nutzer B beeinträchtigt.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Einzige Ausnahme für Spezialdienste sind Notrufe und sicherheitsrelevante Dienste, wie z.B. zur Steuerung von Personen- und Güter-Verkehr. Alle Spezialdienste sind staatlich zu kontrollieren und auf das Notwendige zu beschränken.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? In keinsten Art und Weise.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht dieser Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Holger Müller

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
They should only be able to monitor the quantity of data being sent and received.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISP's should only be allowed to interfere with Internet connections when safety to the general public is a concern.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Kyle Whitham

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Stifling competition.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Don't know

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can't think of any positive ones.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

As little as possible

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I don't care.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes. It could limit access to information that was originally open to everyone like streaming video and audio.

Is there a demand for specialised services? Which services should be allowed this special treatment? There should be no special treatment.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would limit Internet access to everyone.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Just as long as everything is available online.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The Internet was intended to be available to all people everywhere. This is of huge importance to users all over the world.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I don't know.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there is no demand. These are simply ideas from ISP think tanks to drub up interest and make more money. Prioritizing may threaten my internet freedom, which should be as valued as the next person's, regardless of what we choose to pay.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Internet freedom is a true driver of ideas because it is such a widely and immediately available source of information and inspiration. To restrict that would be to limit the confines of the individual's mind.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Tommy Wharton

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No special treatment.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No demand. It will limit rights as a user. Look at China. It's the same thing. I do not want anyone deciding what is important for me to have access to or not to have access to. Either way it's censorship and that is not something anyone should want.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I want to be able to find things on the internet made by indie and niche designers and producers. I have no interest in purchasing things made by the majority of mainstream, monolithic corporations and the internet allows me to do this. With ISP providers strangling small businesses it will kill them and anyone else seeking to find a market online. That is not acceptable.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No priorities.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Pricing everyday people out of a free world wide web.

Is there a demand for specialised services? Which services should be allowed this special treatment? The only specialized services that I would think prudent to CANCEL altogether are sites that promote violence or child pornographers... that's it.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

yes

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No. These do limit my rights.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the content of traffic is not their business. They are not the police.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None. The internet is about free information. No arbitrary entity gets to regulate that.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating could definitely prejudice against the use of sites that are not favored by the service provider.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

When money rules, democracy suffers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

If there is any restriction on bandwidth use it should be completely based on volume and be agnostic to source or type of content.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Average and available speed, quality of service parameters.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If provided at an initially low cost, without the user being made aware of what he/she is losing, there will of course be a demand. That is also the case for drugs, as we were all taught in school. If my operator allows free streaming of certain services, someone else is paying for it, either the provider, or the user through other hidden fees. Service providers which can not or do not want to pay for the free streaming to the users will then become more expensive, reducing the real choice of the user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

New businesses and new ideas will have much higher barriers to entry, slowing down or stopping new services and ideas. Existing service providers will act according to the incentives specialized services put forward - they are likely to innovate less as new providers are prevented from getting the same access to the end-user, and for the existing providers a larger share of their running costs will go to pay for the specialized services, while their incentives for investing in innovation will be limited. For the users, for innovation, and for society at large, there are no long-term positive effects whatsoever of creating a rent-seeking oligopoly.

Is there a demand for specialised services? Which services should be allowed this special treatment? A false demand can be created, but the real demand is for real and equal access to all services. If any services should be allowed priority, it should be limited to emergency alerts/information for tsunami-like situations.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Management of traffic, quality of service and speed are all important. I certainly would want to know if some of my content is "sponsored" through special services.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. ---

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Netflix is an example of a service that could potentially never flourish if restrictions on the open internet are pushed through. New companies bringing fresh concepts to the market will be stifled by the fact they can never compete with a larger corporation who can run their content through a "fast lane"

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I disagree.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Matthew Weller

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I would like information on all three of these items.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Carl Gendvil

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

**\*Please enter your name/organisation\***

Roman Reiß

**\*Is there a demand for specialised services? Which services should be allowed this special treatment?\***

I don't think there is a demand for Specialized Services right now. Even the Supporter failed time and again to give specific examples where the normal connection are not sufficient. Therefore it should only, if at all, be allowed for services where it is proven that normal treatment is not sufficient by an interdependent committee outside of the service providers.

**\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\***

If specialized services will become a widespread phenomenon, it will only enhance the grip of the big players on the market. Those who can pay for the special treatment will prevail at the cost of start-ups. There should not be a 2-class Internet where speed can be bought for money.

**\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\***

zero-ratings seem like a benefit for the end-user, but at its core it will stifle competition, making the service providers a gatekeeper for success for other online players. This should be avoided at all costs.

**\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\***

Monitoring the Content of the Traffic will be a gross violation of the privacy of the user and should under no circumstance be allowed.

**\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\***

The ISP should not be allowed to interfere with my internet connection. There should provide a connection at the contracted speed and with the contracted Volume (if any).

Also in my opinion the term "Flatrate" should be protected and allowed only to be used for a unlimited contract without Volume restrictions and throttling. The current praxis of selling a "Flatrate" that will be crawling down to snail speed after a certain volume needs to be stopped. There should be a legal limit of throttling, if such conditions are part of the contract, for example, that at least half of the contracted Speed has to be available.

End-User also need to be protected form one sided Contract-changes that introduce throttling and other unfavorable conditions in long term contracts.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

Transparency should be important. As I said above, in my opinion the Term "Flatrate" should only be allowed to be used for a unlimited connection without throttling and other restrictions (like excluding certain services like VoIP, P2P etc).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich lese, sehe und höre Inhalte aus Grundversorgungs-Quellen: Internet Archiv, Wikipedia, Wikimedia, Deutschlandfunk, idealistische Blogger. Zero-rating gewerblich Orientierter beschädigt unsere Gesellschaft nicht nur weil es diese Dienste ins Stottern bringt und Infofreiheit mühsam macht. Schädlich ist auch der gleichgeschaltete Infolärm, der Infovielfalt verkümmern lässt.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Spezialdienste, angeboten durch Oligopolisten, haben Offenheit und Innovation oft schon behindert: Per definitionem werden sie "notwendigerweise geschützt" - und damit auch gegen Wettbewerb.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Ja, der Bedarf ist da. Bitte nur 'on top', siehe oben.  
Telemedizin (hohe Bandbreite, QoS), IoT (Bedarf für Spezialdienst 'klitzekleine Pakete, hohe Latenz, kostenlos), OneWay (das TV der Zukunft mit CDS in den Netzknoten), Backup/P2P (Riesenbandbreite, aber gemessen pro Tag, kann in der Rushhour auch mal stundenlang einbrechen) usw! Man sieht: Der Spezialdienst ist das angebotene Dienstemerkmal des zusätzlichen (!) Anschlusses: QoS, kostenlos, CDS, Tagesdurchsatz. Das ist der Infrastruktur-Teil. Die inhaltlichen Programme bitte nur wettbewerblich.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Auf keinen Fall! Diensteeinteilung führt zu Inhaltsüberwachung, zur Diskriminierung ökonomisch nicht optimierbarer Inhalte: Verschlüsselung wird diskriminiert "weil sie ja vorsätzlich unkomprimierbar gemacht wurde!". TOR wird diskriminiert "weil der Kunde durch Pingpong-Traffic vorsätzlich das Internet verstopft"

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Nur falls dies einzelvertraglich mit mir vereinbart wurde UND ich ein gewerblicher Kunde bin UND parallel ein separater Vertrag für einen normalen Anschluss besteht: Ist wie Grundversicherung für Alle ohne Versicherungsfremdes. Obendrauf gerne.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Verpflichtung zur Veröffentlichung all dieser KPIs zusammen mit Anbieter und Geodaten

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Christian Martini

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Stuff like free facebook usage on data cap is in my subscription right now. This makes facebook more attractive than for instance twitter.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Seems to me that it can make sense to prioritize latency sensitive traffic like voice and video streaming. Just shouldn't be something that companies should pay for..

Is there a demand for specialised services? Which services should be allowed this special treatment? Definitely seems to be some traffic that is more latency sensitive than other traffic so it would make sense to have some prioritization.. But it should be done on that basis and not on payment basis.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

---

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
The only services which should be prioritized are ones offered by the government like e.g. the police

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No what I do is my business

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
They shouldn't interfere. If I want a prioritized Service I can tell my router to do it myself

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I would like to get all information about how my data is handled and why it's too slow sometimes

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Verbraucher werden zu den zahlenden Unternehmen getrieben, da bei den anderen ja Datenvolumen anfällt. Zum Beispiel haben es alternative Musikstreamingdienste schwerer wenn Traffic von Spotify nicht gezählt wird. Die Nutzung bei Spotify geht dann "auf's Haus" und bei allen anderen Anbietern wird die Nutzung vom Internetvolumen abgezogen. Viele Kunden werden sich deswegen dann für Spotify und gegen die (möglicherweise) besseren Alternativen entscheiden, was den Konkurrenzkampf dämpft.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Ich sehe keinen Bedarf an Spezialdiensten. Jede Veränderung des Weges eines Paketes aufgrund dessen Inhaltes verletzt die Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? NEIN! Ein Paket ist ein Paket. Der Inhalt darf nicht den Übertragungsweg beeinflussen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? GAR NICHT! Was welche Priorität bekommt, ist immer noch meine Entscheidung. Der Internet-Provider ist nur für die Übertragung zuständig.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Schön wären nicht nur die meist falschen "bis zu" Angaben, sondern auch z.B. durchschnittliche Geschwindigkeit oder Ping.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Mit freundlichen Grüßen,  
Konstantin Hartl

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating allows special deals between giant companies to eliminate competition, leading to poorer choices and services, and stunting innovation, ultimately affecting everyone negatively. This shouldn't be allowed at all. In worst case, it could also lead to favoring sources of information that an ISP prefers, which has huge political/corruption potentialities.

Is there a demand for specialised services? Which services should be allowed this special treatment? I can't think of any.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None, it should be even.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Any and all would be helpful.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Tyler Newton

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Consumers rights need to be guaranteed for a free and equal internet, without zero-rating to influence consumer behaviour. End-user/consumer should keep autonomy.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If specialised services are allowed, it would move innovation towards inequality instead of equality - not desired. Open internet will become more closed because the foundation is not equal anymore.

Is there a demand for specialised services? Which services should be allowed this special treatment? None pop to mind.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No monitoring of content!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all - none of their business.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive more information on my connection, especially as for me, and often also others, it doesn't seem to be what is promised! Speed and connectivity range is way lower.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I want to be able to use the internet unfettered. I do not believe there is any place for interference in my ability to use the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

These kinds of practices provide an unfair advantage for some users over others. This is fundamentally unfair. The internet should be free from practices that provide unfair and frankly unnecessary advantages for certain classes of individuals and corporations.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to be able to monitor my upload and download speed at all times and know that my service is not being throttled or otherwise compromised. My traffic should never be "managed" or otherwise interfered with.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen

würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Philipp Ott

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the ISP should not be allowed to monitor my traffic.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

free and full internet stream should be allowed worldwide at a low and it's own costs.. we will build up a better world for all of GODs ppl, there is no place left for Satan and Mammon and all of their evil followers! With my father JHWHs help! Amen!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

see last picture, I've written, it's the same ground

Is there a demand for specialised services? Which services should be allowed this special treatment?

I think, clinics and doctors should be able to work together worldwide, to help the ppl, wich need help, but just for helping ppl and learning, NOT for making profit out of it!!! Amen!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

of course not, I pay for a unlimitet volume for every month

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

never should be allowed, to stream down the flow, just for making money and profit! it is worse enough!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

it is enough how it is now, a better rate is wishfull... the idea and practice, like in some parts of Canada is the best for my knowing.. free internet and phone through the energy- cables to every house and beeing..

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. My name/organisation:

Andrea Bracht

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices such as zero-rating could interfere with the even functioning of the net, disincentivizing ISPs from fairly supporting independent web traffic and disadvantaging new companies and individuals who seek to share content or services. No commercial practices should be permitted that may interfere with the overall functioning of the net for commercial gain.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services may have the potential to offer new and useful services to internet users, but they must be treated with care to make sure that they do not encroach on traffic or bandwidth needed by standard internet services and users. They should only be permitted when it's clear that they will not interfere with the availability, speed, or quality of standard web use. Allowing specialized services when not absolutely necessary may result in unfair competitive environments in the commercial sphere, while potentially having a negative impact on similar services or overall web traffic. Reclassifying existing or new but web-friendly services as "specialized services" would be unfair and would give preexisting wealthy companies an advantage over competitors who could not afford to pay for such a fast lane.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Specialized services should only be allowed when they meet the two conditions of not being able to function correctly over a standard internet connection, and not interfering (e.g. by taking extra bandwidth) with the availability, speed, or quality of standard internet connections.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I do not believe that ISP should be able to monitor people's web traffic, including its content, as this would be a violation of the privacy of users, be they individuals or corporate or other group users. Exceptions can be made in the case of a legal warrant, but web traffic management and similar concerns are not a good reason to intrude on people's privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I oppose allowing ISPs to interfere with web users' connections, e.g. by throttling or prioritizing different types of traffic. This would discriminate against certain users, retard certain startup companies, and encourage downgrading of certain traffic. The internet is a complex and evolving system with different types of traffic - e.g. video and peer-to-peer, etc. This traffic is increasingly and unpredictably important to the political, commercial, social and artistic spheres. Net neutrality must be maintained to assure an even playing field and allow important new developments and trends in communication.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should provide clear, accurate, understandable, and current information on the nature and state of internet connections, including minimum, maximum, and average upload and download speeds. This important transparency would allow users to make informed decisions on how and when to use various services.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Andrew Johnson

Kind regards,  
Glenn Welsh

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:  
Sebastian Schmitt

Is there a demand for specialized services? Which services should be allowed this special treatment? I am not sure, what a specialized service could be. But I know for sure, that the commonly cited examples like remote medical surgery or autonomously driving cars which need to communicate to some infrastructure are just pure nonsense in this context. No sensible person, company or institution would want such services connected through the "normal" internet!

Commercial practices, especially zero-rating, will lead to ISPs that will misuse their power and the access to their customers to pressure content and service providers to meet their demands (if they want to have access to their customers).

No packet inspection should be allowed by the ISPs.

All traffic should be equal.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Sebastian Schmitt

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich als Verbraucher kann durch Zero-Rating benachteiligt werden in dem große kommerzielle Dienste sich eine Schnelle Verbindung zum Endverbraucher einkaufen. Dadurch werden kleinere, neutrale Dienste (und StartUps) benachteiligt. Als Endkunde kann ich dadurch z.B. nicht mehr frei wählen welchen Video-Streaming Dienst ich bevorzuge, weil ggf. nur ein Dienst durch meinen Provider eine bevorzugte Bandbreitenverbindung bekommt.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich sehe bei der Offenheit des Internets eigtl. nur Nachteile weil sich nur bestehende Großunternehmen solche Spezialdienste leisten können, nicht aber neu gegründete Unternehmen. Das fördert meines Erachtens nach die Bildung von Oligopolen weil neue Marktteilnehmer durch höhere Einstiegshürden einen Wettbewerbsnachteil haben.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine. Dienste die diese Sonderstellung benötigen (Medizin, Verkehr) sind in der Regel bereits speziell per Intranet und eigener Bandbreite ausreichend vernetzt.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
so wenig wie möglich. Am liebsten gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit und Traffic-Management

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese

treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Ingo Sauer

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
zero rating is a bad idea.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
specialized services is just another name for priveleged users. not a good idea.

Is there a demand for specialised services? Which services should be allowed this special treatment? although there is a demand, specialized services wipes out the democratic premise of an open internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all of the above.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Richard Smith

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Mary Whitehead

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive, better working specialised services but the negatives of stifling of minority voices and open internet outweighs that by far.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Not enough to justify the profound negatives

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Equal treatment

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Shane Deal

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No - you should simply offer more flexible internet service plans.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Aggregation of content into copyright networks, less freedom of information.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I believe there is a demand for commercial practices such as zero rating due to the introduction of unfair data caps making it more appealing to use services that don't count towards such caps as this allows the user to better handle their monthly allotment. However, this clearly favors companies that are able to pay for such a privilege and ultimately increases the market barrier to entry which lowers competition. It also has an effect on someones ability to use the internet freely. We should only be paying for bandwidth, not data as that is simply another form of double billing someone for the same service.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Some positive impacts of specialized services could include a dedicated emergency request handling system and a well integrated ecosystem of apps that work well together. However, the negative impacts of reduced competition, degradation of services due to the stagnative effects of monopolies, and the penalty imposed on end users for not using these "free" services currently outweighs such benefits.

Is there a demand for specialised services? Which services should be allowed this special treatment? The only specialized service that could be considered is emergency services over IP. No other service should be allowed special treatment.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The ISP should provide a page that is easily accessible, clearly labeled, and provides clear, accurate, and concise information on what plan a customer is using, what speeds that plan offers, including the maximum and average speeds of the service. There should also be additional information available on how different services may be affected through the use of the service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Our right to privacy must be preserved.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I do not believe that ISPs should be able to interfere with my Internet connection through prioritization of online traffic. Throttling is only permissible in order to ensure a stable connection for the users during periods of high use as a function of available bandwidth (for example, total use of all users over dedicated lanes is greater than 99%). However, there should be safeguards to prevent ISPs from failing to upgrade their systems in order to keep charging more people while throttling continues to be used.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

By prioritizing certain services, websites, and functions over smaller and less powerful competitors (through the zero-rating practice) a clear divide is created between the haves and the have nots. Paid content services are not comparable to these practices, for they do not create this divide. By making favored content not count towards one's data total, these lesser known websites get even less traffic. This gives ISP's a stranglehold over the entire Internet, and that is something that should not be allowed. These practices definitely limit my rights; I will not stand for them.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"Specialized Services" reeks of discrimination. Just imagine: content priority given to services that the ISP supports and kilobytes given to the rest of 'em. They will only restrict the future innovation and openness of the Internet, and they should not be implemented.

Is there a demand for specialised services? Which services should be allowed this special treatment? There is not a demand, and no one should be allowed this specialized treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. That is a total violation of the implied right to privacy in the constitution. My traffic should be for my eyes and its destination only. There is no need for a middle man to direct traffic to the places they want it to go.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should be able to prioritize based on the size of the packets, but not on the type of traffic or level of encryption.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want clear information. I want the minimum, maximum, and average speed listed for each connection IN BYTES. They also should give us information on how different types of applications will be affected by the speed of our connection. Also, ISPs should notify consumers on the effective range of prospective routers in order to maximize coverage throughout a household.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Mr K J Brown

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't see one. Service providers are offering higher tier fibre connections with satisfy the needs for premium service. I pay extra for such a service myself.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
specialized services would increase consumer costs without tangible benefits.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, many student especially international students and expats rely on streaming services to receive content in their own languages. British students use these services to learn other languages. Streaming services are replacing traditional services and need to be protected.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I pay for a service and I should be able to use the service to consume the content and use the services I wish without discrimination. Many paid services are under threat by this bill.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

average speed received

up-time

full costs of service in a single figure

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, this is an invasion of privacy and will result in anything good.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein!!!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider

einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Günther Kahle

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Nein. Eine Klassifizierung nach Typ (z.B. für VoIP) wäre akzeptabel, sodass diese mittels QoS bevorzugt werden. Dies muss dann allerdings nicht abhängig vom Provider oder ASN erfolgen, sondern nur Aufgrund des Datentypes (z.B. RTP-Traffic)

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Durch z.B. das negative Peering-Verhalten der deutschen Telekom wird ein belebter Markt verhindert und gerade kleine Provider und Anbieter haben echte Probleme bei der Bereitstellung von Dienstleistungen wie VoIP.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Portblockaden,  
Trafficlimits  
QoS-Priorisierung  
Filterung  
IPv6-Konfiguration

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein! Modifikationen sind ebenfalls absolut nicht-tolerabel!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Bestimmte Konfigurationen wie z.B. das Blockieren von Port 25 als Standard sind OK, allerdings muss es immer eine Möglichkeit zum Opt-Out geben.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das

Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I do not trust the providers in the USA for this. Each population must decide for itself.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I'd say very little.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behavior in itself.

Transparency has limited scope in fixing problems, particularly in this context. And transparency without accountability is relatively useless.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Thank you for considering these matters carefully.

Kind regards,  
Theodore Reynolds

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Keine Dienste sollten Sonderstellungen bekommen.

Zum Beispiel bei dem oft erwähnten Fall des Krankenwagens, der schnell mit dem Krankenhaus Daten übermitteln muss, würde es eventuell als Spezialdienst Millisekunden schneller gehen, was keine relevanten Vorteile bringt.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Internet-Provider sollen nicht das Recht haben, in Pakete zu schauen, um diese "besser" managen zu können, sondern sie sollten alle Pakete einfach zu stellen, unabhängig vom jeweiligen Inhalt.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw.)?  
Mein Internet-Provider sollte nicht abhängig von Inhalten oder Protokollen drosseln. Und auch gar nicht erst Informationen sammeln, anhand derer er drosseln könnte.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Quality-of-Service und nicht Traffic-Management (da es kein Traffic Management geben sollte)

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Ron Baginski

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. der sogenannte freie wettbewerb wird erheblich eingeschränkt.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
einseitige informationen, beeinflussung

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
nein

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
verständliche ausführliche informationen über geschwindigkeit und wer ein eingriffsrecht auf meine daten hat

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den

Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Gabi Diers-Legantke

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I'm not that up to speed on this.

Is there a demand for specialised services? Which services should be allowed this special treatment? I'm not sure and am not up to speed on this.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Again, I'm not up to speed on this.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Everything that is pertinent to the best service that is available.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Unless there is something at play that I don't know about, ISP should NOT interfere with my internet connection.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP shouldn't be allowed to monitor my traffic. I'm sure it's being done now, but that doesn't make it right.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

no

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It should be totally open and uncensored

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I do not believe so

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Just that is open and uninterfered with

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NOT AT ALL

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Domestic traffic should be unlimited by commercial needs.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services without consumer protections would be detrimental to the future of the internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only if abusive amounts of traffic are going over domestic lines.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I can monitor my own connection.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein, es gibt keinen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating. Zero-Rating verzerrt die Konsumententscheidungen aller Bürger online. Subventioniert der Staat gewisse Branchen, so muss dies neutral geschehen. Betrachten wir dies am Beispiel der Automobilbranche. Soll der Automobilmarkt angekurbelt werden, so wäre es unfair würden lediglich Autos von bestimmten Herstellern wie z.B. BMW subventioniert werden. Mehr Menschen würden beim Kauf eines Autos zu einem BMW als zu einem VW neigen, denn dies ist für sie wirtschaftlich effektiver. Das würde jedoch manche Hersteller benachteiligen.

Durch Zero-Rating würde genau das gleiche geschehen: eine Verzerrung der Kaufentscheidungen. Würde der Traffic von Spotify nicht mehr das Kontingent von 500MB monatlich ankratzen, so würden mehr Menschen zu Spotify wechseln, obwohl ein fast identisches Angebot auch bei Konkurrenten für den gleichen Preis zu haben ist. Musikstreaminganbieter wie Deezer oder Rdio könnten es sich eventuell noch leisten auch Sonderkonditionen mit ISPs auszuhandeln, um mit Spotify wieder auf einer Höhe konkurrieren zu können. Doch kleine junge aufstrebende Unternehmen hätten keine Chance sich solch teure "Vorteilspackungen" und Sonderstellungen am Markt zu erkaufen.

Dies trifft nicht nur auf die Musikstreamingindustrie zu, sondern ist auch gleichermaßen auf alle anderen Bereiche des Internets übertragbar:

Videospielanbieter wie Valve haben verglichen mit kleinen Unternehmen deutlich höhere Chancen auf Deals mit ISPs, damit ihr Downloadtraffic bevorzugt behandelt wird.

Videostreaminganbieter wie Amazon, Netflix, Youtube oder Facebook verglichen mit z.B. Watchever. etc.

Wie sollen auf einem solchen Markt noch neue innovationsgeladenen motivierte Unternehmer Fuß fassen, ohne sich gleich in Abhängigkeit von Investoren oder ISPs zu geben? Laut dem Vorstandsvorsitzendem der Deutschen Telekom AG, Timotheus Höttges, benötigen gerade kleine junge Unternehmen seine "Spezialdienste" um mit großen Wettbewerbern mithalten zu können. Quelle: <https://www.telekom.com/medien/managementzursache/291708>

Doch meiner Meinung nach ist genau das Gegenteil der Fall: Heutzutage ist es möglich für ein paar Euro im Monat Server bei Anbietern wie Hetzner zu mieten. Können große etablierte Unternehmen nun noch Sonderstellungen durch Zero-Rating-Verträge kaufen, so haben diese kleinen Unternehmen neben den Serverkosten das Problem auch im Zero-Rating-Kampf mitzuspielen zu müssen, um überhaupt eine Chance mit ihren Produkten auf dem Markt zu bekommen. Timotheus Höttges ist der Meinung es sei für diese StartUps sehr leicht möglich auch in dieses Geschäft einzusteigen: "im Rahmen einer Umsatzbeteiligung von ein paar Prozent". Hier wird von Umsatzbeteiligung gesprochen, NICHT von Gewinnbeteiligung. Ein paar Prozent Umsatz, bedeuten 2% aufwärts. Bei knapp kalkulierten Angeboten, dies ist heute auf einem globalen Markt nötig - möglich gemacht durch das Internet - Haben kleine Unternehmen (erst recht) nur sehr wenig Prozent Gewinn vom Umsatz, damit sie überhaupt erst in den Markt einsteigen können. D.h. ISPs wie die Telekom wollen sich an diesen kleinen Unternehmen bereichern, indem sie ihnen große Teile bis alles ihres Gewinnes abnehmen. Kommen diese Unternehmen später groß raus, weil sich ihre Produkte als konkurrenzfähig mit denen anderer namhafter Hersteller gezeigt haben, so steigen auch die Gewinne. Jedoch werden die Zero-Rating-Verträge, die zuvor mit ISPs abgeschlossen

werden mussten, um überhaupt erst einmal auf die gleiche "netztechnische" Stufe mit Giganten zu kommen, nicht nur für die Anfänge kleiner Unternehmen gelten. Timotheus Höttges erhofft sich meines Erachtens hierbei sehr große Einnahmen - von allen Beteiligten. Internetdiensteanbieter schaukeln sich so nach oben und ISPs versuchen alle beteiligten zur Kasse zu bitten, um überhaupt erst die Möglichkeit, mit der Konkurrenz mithalten zu können, zu bekommen.

Würde ein StartUp jedoch mit seinen Produkten scheitern, so verschulden sich junge Unternehmer umso mehr. Denn springen gerade einmal 2% Gewinn vom Umsatz ab, jedoch will die Telekom alleine bereits 3% Umsatz, lediglich für eine "nicht absichtlich verengte Leitung + Zero-Rating-Verträge". So müssen sich diese Unternehmer verschulden um überhaupt erst einmal auf den Markt kommen zu können. In dieser Verschuldung von 1% des Umsatzes sind aber noch gar nicht die Kosten für Server (z.B. bei Hetzner - ja, große Unternehmen besitzen das Kapital eigene Serverparks zu bauen, jedoch trägt die Telekom hier rein gar nichts dazu bei hier kleine Unternehmen zu unterstützen) oder die Zero-Rating-Verträge mit anderen ISPs eingerechnet. Wenn jeder ISP "ein paar Prozent" Umsatzbeteiligung will, wo soll das hinführen? Mit einer Unternehmensgründung gehen Risiken einher, das ist ganz normal. Kommen die angebotenen Produkte/Dienstleistungen an, oder nicht? Doch spezial-Dienste von ISPs erhöhen diese Risiken ungemein und erhöhen sogar die Gefahr des Scheiterns. Dies hindert Innovation und den Fortschritt, denn Menschen mit Ideen überlegen es sich nun noch zehnmal, ob sie wirklich ein solch erhöhtes Risiko bei der Gründung eines Unternehmens eingehen wollen, denn scheitert ihr Vorhaben, so sind sie Hals über Kopf verschuldet. Die Vorstellung junge Unternehmen können sich Spezialdienste inklusive Zero-Rating leisten ist in meinen Augen falsch! "Kommerzielle Praktiken" wie z.B. Zero-Rating führen zu einer Kaufentscheidungsverzerrung der Bürger und zu einer hohen Verschuldung junger Unternehmen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Es gibt keinen Bedarf an Spezialdiensten der ISPs. Keinem Dienst sollte solch eine Sonderstellung verliehen werden dürfen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, Internet-Provider sollen meinen Datenverkehr unter keinen Umständen überwachen dürfen, erst recht nicht durch Deep-Packet-Inspection. Traffic, egal welcher Art, egal welcher Quelle, egal welchen Zieles, muss und soll gleichbehandelt werden. Die Überwachung von Traffic ist der Beginn eines Zwei-Klassen-Internets. Können ISPs durch Deep-Packet-Inspection genauere Informationen über den Datenverkehr erfassen, so wirft dies einerseits datenschutzbedenkliche Fragen auf (wer nutzt welche Dienste - diese Informationen können verkauft und schnell gegen Nutzer verwendet werden) und ist andererseits die Grundlage verschiedene Onlinedienste wie etwa VoIP-, P2P-, Videostreaming-, Audiostreaming-, Videospieldata etc. zu gruppieren und dafür extra Geld zu verlangen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Mein Internet-Provider sollte meinen Internet-Anschluss überhaupt nicht beeinflussen können oder dürfen. Es sollte allen ISPs verboten werden manche Datenübertragungen zu drosseln oder gar zu bevorzugen.

Denn dürften sie dies, so würden sie das Netz, d.h. die Kabel im Boden, nicht weiter ausbauen, um absichtlich Engpässe hervorzurufen. Denn dort wo Engpässe vorliegen, dort können die extra „Bevorzugen“ verkaufen. Dies bedeutet mehr Einnahmen. D.h. wäre es ISPs gestattet bestimmte Dienste absichtlich zu drosseln und manch andere zu bevorzugen, so führt dies automatisch zu einem Stagnieren des Netzausbaus. Es liegt gar nicht im Interesse der ISPs die Verfügbarkeit und die Geschwindigkeit des Internets zu verbessern, wenn es auch anderes möglich ist mehr Geld einzunehmen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Es müssen strengere Regeln im Bezug auf Geschwindigkeiten gelten. ISPs werben mit "bis zu" Klauseln. Doch wie viele Verbraucher wissen das? In Werbeanzeigen wird groß von 100Mbit/s geschwärmt, doch im Kleingedruckten steht "bis zu" 100Mbit/s. Ankommen tun letztendlich nur 60Mbit/s. Bis den Kunden dies klar wird, so sind sie bereits mehrere Jahre an einen Vertrag gebunden. Häufig wissen oder merken Kunden dies gar nicht, denn dafür fehlt ihnen das nötige Wissen. Was würden denn Provider davon halten, wenn wir lediglich "bis zu" 100% der monatlichen Vertragskosten zahlen würden? Verbraucher sollten lediglich dazu verpflichtet werden, den Betrag der tatsächlich ankommenden Geschwindigkeit (dies betrifft Up- wie auch Downstream), zahlen zu müssen. Das bedeutet, wenn mit bis zu 100Mbit/s geworben wird, aber lediglich 50Mbit/s ankommen, so sollte man auch lediglich 50% des Preises zahlen müssen. Denn nur so können Konsumenten aus der Werbefalle ungeschadet heraustreten. Internet-Provider sollten zudem verpflichtet werden Maximal-, Durchschnitts- und Minimalgeschwindigkeit in gleicher Form anzugeben. Wird mit einem 1 Meter Schriftzug von einer Maximalgeschwindigkeit geworben, so muss auch die Minimal- und die Durchschnittsgeschwindigkeit genauso gezeigt werden, nicht nur im kleingedruckten. Denn heutzutage ist es für uns Verbraucher gar nicht mehr möglich all die AGBs und Datenschutzrichtlinien und allen Diensten die wir nutzen durchzulesen. Lauf des Films TermsAndConditionsMayApply würde dies jeden Menschen durchschnittlich 1 Monat im Jahr kosten, lediglich zum durchlesen dieser Texte. Dies klingt zuerst etwas viel, doch überlegen Sie sich doch mal was Sie alles nutzen: Amazon, Google-Suche, Googel-Kalender, Googel-Docs, YouTube, jede App ihres Smartphones hat AGBs und Datenschutzrichtlinien, Windows, IOS, Android, Google-Playstore, Zalando, Ihr Emailprovider, fast jede Internetseite, die Sie besuchen, etc. Selbst wenn jemand die Zeit findet all diese Texte durchzulesen, so besteht noch ein weiteres Problem: das Verstehen. Denn all diese Schriften sind in einer Juristensprache verfasst, die absichtlich unverständlich und mehrdeutig formuliert. Zudem werden AGBs und Datenschutzbestimmungen absichtlich in GROßBUCHSTABEN GESCHRIEBEN, DAMIT SIE SCHWERER ZU LESEN SIND.

Zudem will ich wissen, welche Spezialdienste mein ISP anbietet und mit welchen Unternehmen er bereits solche für welchen Preis abgeschlossen hat. Der Schwerpunkt liegt hier darauf, was Unternehmen dem ISP tatsächlich gezahlt haben. Wie viel Prozent des letztjährigen Gewinnes hat welcher ISP in den Netzausbau gesteckt. Wie viel Euro waren das? Wo? Welche Technologien? Es muss mehr Transparent gefordert werden und es muss eindeutig geregelt sein, wo und wie ISPs welche Informationen darlegen müssen, denn ansonsten ist es schlichtweg einfach unmöglich ISPs aufgrund ihrer Leistungen zu vergleichen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best

Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Jürgen Reichert

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
no, any limiting of my rights is unacceptable.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
cost more and get slower speed

Is there a demand for specialised services? Which services should be allowed this special treatment?  
not sure

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all the above

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
it should be hands off

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
William Korbelt

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No there is no demand from actual consumers. This is an issue that there is very little education about, because corporations want to buy the internet and strangle its fluid and free nature.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positives from an individual perspective. Commercial interests perhaps but these interests are at the detriment of free speech, free art and free choice for consumers. Why should the economic power of conglomerates allow them to crush our access to the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

A comprehensive report every two months about all the relevant factors in a way that is easy to understand and accessible for consumers so they can assess how legitimately their ISP is acting.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I think they could.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Nur die großen Medienkonzerne können schnell ihre Nachrichten verbreiten. Das führt zu einer schlechteren Qualität der Nachrichten.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Die schnellen Datenverbindung werden an den höchstbietenden versteigert und damit unnötig teurer.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Für bestimmte Personengruppen oder Unternehmen sicher ja, aber die restlichen Personengruppen und Unternehmen wären benachteiligt. Deshalb sollte keiner diese Sonderstellung bekommen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Garnicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Geschwindigkeit  
Auslastung des Netzes  
Quality-of-Service  
Traffic-Management

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das

Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Steve Högner

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Important notice: Text answers are in GERMAN language.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Wenn bestimmte Dienste von Anbietern „eingepreist“ werden, während Daten aus anderen zusätzlich berechnet werden, führt dies dazu, daß die Wahlfreiheit eingeschränkt wird. Die „kostenlosen“ Dienste bezahlt man bereits mit der Grundgebühr, so daß selbst bessere Alternativen chancenlos bleiben, nur weil diese bereits im Ansatz benachteiligt werden.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Solange „Spezialdienste“ eigentlich gar nicht „speziell“ sind, wäre eine Unterscheidung schädlich. Beispiel: Video-Dienste sind bereits jetzt im „ungeordneten“ Internet funktionsfähig und werden genutzt. Allen solchen Diensten würde eine Priorisierung ihrer Datenströme zugute kommen, weil sie dann weniger von Unterbrechungen bei Bandbreiten-Engpässen betroffen wären. Schädlich wäre eine Vermarktung als „Spezieller Dienst“ dennoch, weil die Anbieter nur ihre eigenen Angebote, beziehungsweise solche, mit denen sie gemeinsame wirtschaftliche Interessen verfolgen, bevorzugen würden. Alle anderen Video-Dienste kämen hingegen aufs „Abstellgleis“ und würden um so schlechter transportiert.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Spezialdienste dürfen – wenn überhaupt – nur solche werden, die im offenen Internet nicht funktionieren würden. So kann man Notrufe absolut bevorzugen, auch wenn damit im Einzelfall andere Daten unterdrückt würden. Das Aufkommen solcher Nachrichten ist normalerweise niedrig und somit die Beeinträchtigung des restlichen Netzes durch eine solche Bevorzugung gering. Außerdem würde hier nicht willkürlich ein Dienst eines Anbieters gegenüber ähnlichen Diensten anderer Anbieter bevorzugt.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Nein, es bestehen da mehrere Gefahren: zum einen, daß technische Notwendigkeiten nur vorgeschoben werden (statt Netzausbau zu betreiben werden „unwichtige“ Daten ausgebremst – was „unwichtig“ ist, bestimmt der Anbieter selbst anhand wirtschaftlicher Überlegungen), zum anderen, daß eine ohnehin vorhandene Prüfungs-Technologie dann auch für ganz andere Zwecke eingesetzt werden kann, so zum Beispiel zum Ausfiltern „verwerflicher“ oder „verbotener“ Inhalte. Demokratischen Politikern erscheint letzteres für gewöhnlich unkritisch, die Gefahr besteht aber, daß autoritäre Parteien gewählt werden und dann bereits eine (halb.)fertige Zensur-Infrastruktur vorfinden oder daß die Unternehmen die Infrastruktur zum eigenen Nutzen zweckentfremden.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Dies sollte von vornherein ausgeschlossen werden. Die Argumente für solche Eingriffe klingen zunächst einleuchtend, beispielsweise Daten von Diensten zu bevorzugen, die eine kurze

Reaktionszeit erfordern oder keine „Pausen“ vertragen, können aber leicht dazu mißbraucht werden, vom Anbieter unerwünschte Datentypen zu unterdrücken oder zu benachteiligen, beispielsweise IP-Telefonie-Daten im Mobilfunknetz. Auch können nötige Maßnahmen zum Ausbau der Infrastruktur hinausgezögert werden, wenn man Daten abseits des „Massenmarktes“ ausbremst.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Heutzutage werden gerne Mischkalkulationen mit Maximal-Bandbreiten beworben; wer das Maximum ständig ausreizt, ist dann jedoch als Kunde nicht gern gesehen. Realistische Angaben sind besser als Pseudo-Pauschaltarife, in deren Kleingedrucktem steht, daß die Maximalbandbreite nur für die ersten paar Gigabytes im Monat gilt.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Christoph Franzen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation: Luka Vandervelden/IT student

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry.

These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating has the potential to create a "walled garden" which would block not-obviously-profitable innovations from their potential consumers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Lack of access to exclusive specialized services could become a barrier to entry for new innovations.

Specialized services could provide an incubator for innovative technologies which could not naturally evolve or grow in the open internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Yes. In environments where resources are scarce ( e.g. areas with crowded radio spectrum ), low bandwidth services with high humanitarian value ( e.g. emergency communications/broadcasts, human to human text messages) may be prioritized .

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Industry and consumers could benefit from a clear and enforceable definition for the word "Unlimited".

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, except with a specific detailed warrant based on hard evidence.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not discriminate between classes of traffic, that should be the customer's prerogative.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein, Zero-Rating verhindert die Vielfalt bei der persönlichen Auswahl an Diensten. Ferner ist es sowieso schwachsinnig Volumenbegrenzungen einzuführen, um damit eine angebliche Überlastung des Netzes entgegenzuwirken, denn am Anfang des Monats haben z.B. alle Anschlüsse wieder volle Bandbreite und beginnen dann auch mit dem Runterladen.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Die Selbstbestimmung eines jeden wird eingeschränkt.

Große Unternehmen werden gefördert und kleine zurückgedrängt.

Die Nutzung des Internets beschränkt sich nur noch auf wenige Website.

Wenige Dienste können noch besser einen Überblick über unsere Daten haben.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

zeitkritische Systeme wie VoIP;

lebenswichtige oder lebenserhaltende Systeme, die auf eine Internetverbindung angewiesen sind

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Bevorzugt sollte nur der Datenverkehr, bei dem das auch technisch nötig ist. z.B. VoIP oder SSH

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Erstmal alles. Möglichst noch die Peeringkapazitäten zu anderen Providern.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen

würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Mit freundlichen Grüßen  
Lukas Pingel

Dear Sir or Madam,

Please take my comment regarding the BEREC net neutrality guidelines creation into consideration.

\*My name\*

Malte Fiala

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

There are no services that should receive special treatment.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Getting rid of net neutrality means favoring big companies with enough cash to "buy out" of any given restrictions.

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

With Drei and T-Mobile we already see global telecom operators implementing restrictions for companies whilst benefiting others.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritize certain types of online traffic (video, P2P, etc)?\*

My ISP should not be allowed to touch my traffic. P2P e.g. is a crucial protocol for most online games clients nowadays.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I want to get all information available to the ISP regarding my internet connection. Examples are as follows:

- uptime
- max bandwidth
- average bandwidth
- delay / ping
- Is my connection QoS managed?
- If so, what services are throttled?

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

K. Arnone

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-Rating beschränkt bereits meine Rechte als Endverbraucher, konkret meine Freiheit mir aus suchen zu dürfen, welche Dienste, beispielsweise Streamingdienste, ich verwenden will. Durch derartige Praxen ist meine Wahl nicht mehr, welchen streaming Dienst ich verwenden möchte, sondern viel mehr, ob mir ein nicht durch Zero-Rating unterstützter Dienst es mir Wert ist dafür weniger Datenvolumen zur Verfügung zu haben.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, da für Datenpakete selbes Recht wie für den Briefverkehr gelten muss.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Mein Provider sollte meinen Anschluss überhaupt nicht beeinflussen dürfen, um die Geschwindigkeit bestimmter Datenübertragungen zu ändern. Die Aufgabe des Providers ist mir einen Zugang zum Internet bereit zu stellen und nicht mein Surfverhalten durch drosseln oder bevorzugen bestimmter Übertragungen zu beeinflussen, bzw einzuschränken.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist

besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Lukas Reitschuster

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
It shouldn't at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All of the above.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Rodolpho Mouta

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Only demand for it is among ISPs & cell phone data.

Is there a demand for specialised services? Which services should be allowed this special treatment? High bandwidth activities like video, science & some online games.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not. Is the post office allowed to read your letters?

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Lightest QoS that is possible.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Anything useful to myself as a power-user.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Ask ATT about throttling and limiting unlimited data. We will sue and win.

Is there a demand for specialised services? Which services should be allowed this special treatment? None!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

911, ecommerce, streaming, etc...

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

My average speed per month so I can see what I am paying for.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Hell no! What should happen is we should be guaranteed minimum speeds and not up-to speeds.

My ISP (Comcast) says I will receive speeds up to 75mb. The geeks will win in the end because there are more of us and we will bring their networks to a stand still.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

0%

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Meiner Meinung nach gibt es keinen Bedarf an Spezialdiensten. Ich bezahle meinen Internet-Provider dafür, dass dieser mir das Aufrufen von verschiedensten Diensten in brauchbarer Qualität ermöglicht. Somit hat er sicherzustellen, dass die Infrastruktur dies auch ermöglicht. Bis zum heutigen Tag hat dies meinerseits auch gut funktioniert!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Das Anbieten von Spezialdiensten führt zur Monopolisierung des Online-Marktes. Die Spezialdienste können diese Macht einfach mißbrauchen und dem Endnutzer nur selektierte Informationen bereitstellen, welche möglicherweise einige Makel vertuschen. Insbesondere kleinere Internet-Zeitungen würden kaum noch gehört werden.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Falls Zero-Rating in Kraft treten sollte, könnten kleinere Startups möglicherweise sich dies nicht leisten. Durch die Abwesenheit einer solchen Methode wurde Innovation im medialen Bereich gefördert und Webseiten wie YouTube, Facebook oder Twitch ermöglicht.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Der Internet-Provider sollte lediglich meinen Haushalt mit einem Internetzugang versorgen und sicher stellen, dass die im Vertrag verhandelte Bandbreite zum Internet im allgemeinen gewährleistet wird. Ich möchte nicht, dass ich kleinere Dienste nur langsamer nutzen kann, für einige extra bezahlen muss oder sogar einige Dienste gar nicht nutzen kann. Falls ich eine bessere Verbindung zu einigen Diensten oder dem Internet im allgemeinen wünsche, sollte ich mich an den Internet-Provider wenden können um einfach eine bessere Verbindung als Endnutzer zu erwerben.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, da dadurch wieder einige Inhalte anderen gegenüber priorisiert werden können. Zusätzlich sehe ich die Gefahr darin, dass der Internet-Provider meine Daten ohne mein Einverständnis kommerziell nutzt und möglicherweise dann noch extra Werbung in die Pakete schleusen kann.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte auf jeden Fall über die maximal mögliche und auch vor allem über die minimal versprochene Bandbreite informiert werde. Dies soll offensichtlich aus dem Vertrag ersichtlich sein und auch bei Nachfragen direkt und offen kommuniziert werden. In diesem Zusammenhang wäre es dann sehr hilfreich, wenn der Internet-Provider dazu noch Beispiele angibt, die realitätsnah gehalten sind, so zum Beispiel welche Auflösung beim Videostreaming flüssig läuft.

Ebenso möchte ich über die maximal mögliche Bandbreite an meinem Wohnort informiert werden, vor allem wenn durch einen Netzausbau Änderungen auftreten.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein. Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Jonas Schenke

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Definitely not

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

it would give more bandwidth to big streaming and downloading websites (eg. Youtube/netflix and/or steam) but would leave smaller companies to rot since they wouldn't be able to pay for the services and would, because of that, have less bandwidth making their service inferior to others.

Is there a demand for specialised services? Which services should be allowed this special treatment? specialised services should be a free thing given to websites with a lot of traffic for free, that way no one would suffer for not having enough income to pay for such services and smaller sites wouldn't need it in the first place.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not at all.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Since i'm an avid user of streaming services and general downloads this would most likely affect me in a bad way.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

i would love to know the amount of packet loss between the ISP and my computer since i never do get the speed i pay for and it's always some random variation.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No interference at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Steven Boss

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There may well be a demand for such commercial practices, but they are likely to limit an end-user's rights and competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services are likely to have a negative effect on communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Sufficient information should be provided by ISPs to enable the user to judge the speed, quality and management of the service.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services hamper freedom of communication

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Definitely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I think that many like to be able to surf "for free" when on a data plan. Sadly this might also mean that other content providers lose. In the long run it is not fair to zero rate a few particular providers if that also means that the rest of the providers are being charged a higher amount of data traffic fees...

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The positive could be that if zero rating is used to give subscribers access to some content providers for free they could then use the rest of their allotted data traffic to explore the net.

The very possible downside of this practice is of course that the zero rated sites must be "earned back" by the isp in one way or the other.

Unless of course that you as a content provider can pay for a zero rating. Which in turn must never mean that the rest of the content providers are punished for not doing this. I can see both be fits but also clear dangers to this practice.

Is there a demand for specialised services? Which services should be allowed this special treatment? As long as there is data traffic restrictions there can always be a need to facilitate access to certain content providers such as health (hospital) police, communal, county and governmental sites as not to restrict the access.

I can also see that non profit orgs. may fall under the specialized services...

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I find it disturbing that they do this, at the same time they must be allowed to manage their traffic to deliver a good service. I hope that there is a way to do that that does not involve content monitoring.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all would be the best, that might of course be naive to believe that it will happen. Today they throttle my mobile data traffic based on the type of account. I think that that is the only way forward as well.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All above.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content

application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
ofcourse

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
negative, especially for consumers

Is there a demand for specialised services? Which services should be allowed this special treatment?  
public transport, military.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
nada, nothing, rien

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all of it

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Keine kommerziellen Praktiken!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Keine wie immer gearteten "Spezialdienste"!

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Es gibt für mich keinen Bedarf.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Auf gar keinen Fall!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Keine Beeinflussung durch Provider!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Traffic-Management

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen

darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Rudolf Tremetsberger

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I do not know.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

These services could either help or hinder the openness of the internet, but must be carefully studied.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is always a demand for specialized services, but they must not hinder the free exchange of information for all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much as is possible. I've always read the fine print.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not interfere; they are a service provider.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every

enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Ed Parks

This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Charles Phillips

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

**\*Please enter your name/organisation\***

Vincent van der Lubbe

**\*Is there a demand for specialised services? Which services should be allowed this special treatment?\***

Only certain emergency services, like police or in case of large calamities. This should be a public regulated decision, not made by the providers themselves.

**\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\***

Providing an infrastructure service should not be treated differently, depending on who uses it or what type of service is rendered.

**\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\***

There will always be a demand for preferential treatment, but this to the detriment of other users. It will lead to a less open and less equal access to education, health, participation in (digital) society and business for the less fortunate, thereby negatively influencing society. The internet effectively is our access to participate in modern society, giving providers the rights to regulate this access is a grave misunderstanding of our common european heritage of civil rights. Don't let businesses decide who is allowed to participate on what conditions.

Imagine that our access to the street would be regulated by the businesses who build the roads, how absurd would this be? We have put the Middle Ages with high way robberies behind us and created a common european market with free flow of people, goods and services. Shouldn't this also be true for the internet?

**\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\***

I'm not an expert on this, I think only if this traffic monitoring is effectively and regularly monitored by an independent third party, which has the power and independent budget to meaningfully

sanction (effective damages which will influence the providers to stop any digression immediately) any digressions based on rules including privacy rights.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

See the above.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

Providers should be reasonably expected to deliver on the relevant promises they make in terms that users can understand. I would welcome if they should be required to communicate this also in their communication with their customers (f.e. in their invoicing). As they do for business users, where explicit agreements on service levels are made (SLAs).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein. Wenn ich 50000 habe sollen alle Webseiten und Programme die vollen 6,25 MB/s DL ausnutzen können

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Besonders kleine Firmen und Seitenbetreiber leiden darunter, wenn sie viel Geld bezahlen müssen um bei den Kunden zu funktionieren. Viele große kostenfreie Dienste wie bspw. YouTube können so kostenpflichtig werden. Für Internetstartups wird es sehr schwer werden ihre Innovationen zu präsentieren

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Da wir in Deutschland mit eines der Länder sind, in dem das Datenvolumen am teuersten ist(35€ = 500MB(+ Allnetflat)), ist es schon in Ordnung, dass wenn z.B. ein Musikstreamingdienst mit im Vertrag ist, dieser nicht auf das Datenvolumen zählt. Trotzdem darf das nicht den anderen Verkehr oder das Datenvolumen insgesamt beeinträchtigen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Garnicht.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, da muss nichts gemanagt werden. Die Datenpakete sind alle gleich. Nur die Größe ist unterschiedlich.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Die mindest Geschwindigkeit und das Maximum, bzw sollten das eigentlich die gleichen Zahlen sein. Und ob der Hacken bei Quality-of-Service gesetzt wurde. Traffic-Management darf es garnicht geben! Und natürlich wann geplant ist, dass und ob der Anschluss ausgebaut wird.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Yannick Felix

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I think specialised services mostly discriminate other , for example new startup services, that cannot afford these kind of services. So i think it has a negative effect on innovations and new services!

Is there a demand for specialised services? Which services should be allowed this special treatment?

No, at the moment there is no demand for a specialised service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only a minimum to provide proper work of services like VOIP

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Importand information for me are: The theoretical maximum up- download speed and the real technical available up- download speed. Active QOS Services (like VOIP). Free charge of router and all necessary usernames and passwords.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Der Bedarf ist definitiv da. Leute wollen Facebook, Spotify und andere Dienste nutzen und sind bereit dafür mit einem Plattform-Lock-In zu bezahlen. Für die Plattformbetreiber geht die Rechnung auch auf, denn für sie ist die Nutzerbindung mehr wert, als es sie kostet, ihnen Zugang zu verschaffen. Die zweite Frage verstehe ich nicht. Natürlich schränkt Zero-Rating die Rechte der ihn nutzenden Endverbraucher praktisch ein, weil der Zugang zu Diensten, die nicht dem Zero-Rating unterliegen proportional erschwert wird. Sonst wäre das Modell ja für die Anbieter unattraktiv. Zero-Rating wäre, wenn ich z.B. über meinen Mobilfunktarif auf Facebook zugreifen kann, ohne, dass die dabei anfallenden Daten auf mein monatliches Übertragungsvolumen angerechnet werden. Das wäre für mich bares Geld wert, denn dann könnte ich den nächst-kleinere Tarifoption wählen und meine tägliche Kommunikation mit meiner Freundin über den Facebook Messenger abwickeln. Dazu bräuchte ich aber ein Facebook Profil, was ich sonst vielleicht mal löschen würde und könnte nicht so leicht auf innovative, neue Messenger umsteigen, wie z.B. Allo von Google. Wie Chatbots zeigen, sind auch scheinbar triviale Dienste wie Messenger immer wieder Feld für aktuelle Innovation. Solche neuen, besseren Dienste sind darauf angewiesen, dass das Internet neutral ist und ihrem Erfolg keine Hürden wie Zero-Rating im Weg stehen. Diese Eigenschaft hat das Internet zu dem gemacht, was es heute ist und es würde ein deutlich anderes, wenn wir sie ändern würden.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste eröffnen neue Geldquellen für Access Provider auf Kosten der eigentlichen Inhaltenanbieter. So könnte z.B. die Telekom z.B. Netflix zur Kasse bitten und damit zusätzliche Einnahmen erzeugen. Das zusätzliche Geld könnte in Netzausbau gesteckt werden und so auch kleineren Anbietern zu Gute kommen.

Schon im ersten Schritt ist dieses Geschäftsmodell jedoch widermoralisch, weil der Access Provider die gleiche Dienstleistung - Ende-zu-Ende-Netz - zwei Mal verkauft. Ein Mal verkauft der Access Provider dem Anschlussinhaber Zugang zu Netflix, ein zweites Mal verkauft er Netflix Zugang zum Anschlussinhaber. Da aber beide Zugänge Duplex-Verbindungen sind, ist es technisch die selbe Sache. Da Netflix sein Geld letztlich vom Anschlussinhaber hat, bezahlt dieser seine Internetverbindung doppelt.

Mit Spezialdiensten verkehrt sich das Geschäftsmodell des Access Providers von einem Dienstleister hin zu einem Gatekeeper. Von einem Access Provider ohne Spezialdienste wird erwartet, dass er seinen Kunden möglichst störungsfreies Internet bereitstellt. Dies ist überprüfbar und Kunden können wechseln, falls sie mit der Qualität der Dienstleistung unzufrieden sind. Als Gatekeeper hat der ISP gerade kein Interesse mehr daran, sein Netz störungsfrei zu halten. Im Gegenteil bieten Netzengpässe ihm die Gelegenheit, Diensteanbieter dazu zu bringen, Spezialdienste zu ordern. Daher sehe ich leider keinen Weg, wie dieses Szenario eintreten sollte.

Als Gegenvorschlag für erhöhte Einnahmen der Access Provider möchte ich schnellere Verbindungen zu höheren Preisen vorschlagen. Der Markt für Internetzugänge leidet seit einem Jahrzehnt

darunter, dass mit Flatrates zu niedrigen Preisen die Einnahmen auf niedrigem Niveau bleiben. Als Differenzierungsmerkmal bleibt aber die angebotene Übertragungsrate. Mit VDSL und VDSL Vectoring besteht die Chance, höhere Preise für höhere Übertragungsraten zu etablieren. Nach oben ist mit Glasfaser Einiges möglich, wenn man sich davon verabschiedet, dort die Übertragungsraten künstlich klein zu halten. Warum nicht 1 GBit/s via Glasfaser für 100 €/Monat anbieten? Einige wären bereit das heute zu zahlen und könnten den Netzausbau für andere mitfinanzieren.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ping, Jitter, Durchschnittliche Verfügbarkeit (99,999% oder was), MTBF, MTRS, Drosselung bestimmter Dienste und/oder zu bestimmten Zeiten, garantierte Mindestgeschwindigkeit, Peerings mit anderen AS, Kapazitäten an Übergabepunkten, Bewertungen großer Inhalteanbieter (Twitch, YouTube, Netflix), Bewertungen anderer AS-Betreiber, wie oft über Traffic-Management in den letzten Jahren eingegriffen werden musste.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Beim Internetzugang kann besser der Router des Kunden QoS auf Basis von DPI machen, im AS der ISPs gibt es dazu keine Notwendigkeit, weil die Kapazitäten ausreichen und im Backbone zwischen AS gibt es keine Möglichkeit, weil so schnelle Hardware nicht verfügbar ist.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Als Anschlussinhaber sollte ich der Einzige sein, der meinen Internet-Anschluss beeinflussen kann. Jeder Eingriff des Betreibers ist als Mangel anzusehen. Meinen aktuellen ISP habe ich danach ausgewählt, ob er P2P zeitweise drosselt oder nicht. Mit HD-Videotelefonie kommunizieren wir mehrmals pro Woche mit Verwandten außerhalb der EU. Diese Dienste sind absolut essentiell für unsere Netznutzung. Ich habe eine einmonatige Kündigungsfrist und kann so wechseln, sollte mein ISP meinen Internetzugang stören. Um sicher zu gehen, überprüfe ich meine Verbindung regelmäßig mit Werkzeugen wie Netalyzr, Speedtest und Neubot.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Die Regulierung verbietet ausdrücklich [Kommerzielle Praktiken](Unter der Regulierung sind kommerzielle Praktiken solche Praktiken, die von kommerziellen Überlegungen ausgehen und nicht von (technisch) effizientem Netzwerkmanagement. Die Regulierung gibt den nationalen Regulierungsbehörden die Befugnis, bei derartigen Angeboten regulierend einzugreifen, damit die Rechte der Benutzer, Information frei und ungehindert empfangen und senden zu können, nicht beeinträchtigt oder verletzt werden.) die die Ausübung der Benutzerechte online beschränken. Zero-Rating widerspricht eindeutig den Absichten des Gesetzgebers, den freien und ungehinderten Zugang zum Internet zu erhalten. Zero-Rating beschränkt die Möglichkeit der Benutzer, Inhalte, Dienstleistungen oder Anwendungen zu verbreiten, das wieder beeinträchtigt Innovation, Dialog und den Austausch von Wissen.

Kommerzielle Praktiken werden in der Regulierung verstanden als jede Beschränkung der Basisfunktionalität des Internet aus kommerziellen Gründen, die nicht für die Funktionalität des Internet notwendig sind

Paid-Content-Dienste (bezahlte Inhalte, z.B. Musik oder Video Streams) unterscheiden sich von Zero-Rated-Diensten, weil dabei der Zugang zu gesamten Internet während der ganzen Zeit nicht verändert wird.

Alle Kommerzielle Praktiken die die Rechte des Nutzers auf freien Erhalt und Verbreitung von Kommunikation einschränken, laufen den grundsätzlichen Intentionen der Regulierung zuwider. Die Regulierung will den freien Zugang zum Internet schützen; kommerzielle Praktiken dürfen daher die freie Auswahl nicht beschränken, indem sie ein Angebot oder einen Dienst bevorzugen. Wenn eine kommerzielle Praktik derartige Nachteile bringt, bedeutet das nicht nur eine Verletzung von Benutzerrechten, sondern ist auch gegen das Grundprinzip der freien wirtschaftlichen Wettbewerbs.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Massive Zensur von unliebsamen Internetseiten. Wie? Ganz einfach: Wer zahlen kann, bekommt Bandbreite. Der Rest guckt in die Röhre. Wer geht schon auf eine Seite, die eine halbe Stunde lang laden muss? Genau dahin würde es führen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Nochmals, N-E-I-N, es gibt keinen Bedarf. Außer dem Bedarf der eh schon Vermögenden, sich so noch mehr in die Taschen zu stopfen und nebenbei unliebsame Seiten schwerer zugänglich zu machen!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Solche Überwachung und Überwachung generell ist letzten Endes nur ein Mittel zur Aufrechterhaltung des menschenverachtenden Status Quo, der Sklaverei mittels eines privaten

Schuldgeldsystems. Auch der vorgeschobene Scheingrund der Terrorismusabwehr dient letztendlich nur diesem einen Zweck. Es wird Zeit, den Verantwortlichen und ihren niederen Beweggründen das Handwerk zu legen. In einer ressourcenbasierten Wirtschaft geht es jedem gut, ganz ohne Krieg, Armut, Kriminalität, Unterdrückung, Politik und dergleichen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht. Stattdessen sollte sich der Internet-Provider Streamingdienste vorknöpfen in Form von Drosselung und/oder Schröpfung. Wenn dieser ganze TV-über-Internet-Mist nicht wäre, wäre genug Bandbreite für alle da.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Alle Informationen, die es gibt.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
TZM

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Steve Anderson

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

"Commercial practices" can be twisted to the Internet's detriment. If such practices are imposed it should be composed by a panel of users and the techs.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

They might raise access charges, at least, indirectly, and throttle the internet for both free expression as well as innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? Can't think of any I don't need.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Averages of internet speed for my various applications. This should be categorized by use, so I can determine their relative values.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The purpose of the internet is to foster open and free communication for each person on the planet. If governments, institutions and businesses can impose any controls whatsoever on the internet--however seemingly innocuous--the internet's promise and fundamental purpose is threatened and free thought vanishes.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NO INTERFERENCE WHATSOEVER WITH MY INTERNET!

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Demand for zero-rated services only exists to the extent that Internet providers treat their utility as a luxury and price it as such. Even then, such a false service would greatly limit a poor user's ability to seek out dissenting opinions and visit the websites of potential employers, perhaps without them even understanding why.

Is there a demand for specialised services? Which services should be allowed this special treatment? Specialized services are simply a bad idea and a secondary means of packaging zero-rating. We should not allow the Internet to be retrofitted such that it acts like cable, no matter how much ISPs wish it behaved that way.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Monitoring traffic, and especially deep packet inspection, should not be tolerated without a search warrant. "Traffic management" is simply a means of creating discrimination, whether based on above-board policies within the bounds of ill-conceived laws or underhanded attempts at silencing unwanted political behavior and extracting bribes from large companies.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Discriminatory treatment of Internet traffic is a concept that should at the lightest be treated with extreme caution and suspicion, and the privacy invasions that would make such an effort possible simply makes it not worth it outside of reasonable suspicions of criminal activity. The mere usage of peer-to-peer services should not in itself be treated as suspicious and potentially criminal activity, as this criminalizes a technology that potentially empowers individuals and small businesses.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I wish to know the maximum, minimum, and average upload and download speed for any given Internet service in my particular municipality. It should be a given that any ISP is private and nondiscriminatory, to the point that this need not be said to the end user and she can instead count on regular inspections to enforce laws which strictly prohibit violations of privacy and neutrality.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Alle Informationen, die die Leistungserbringung mir gegenüber beeinflussen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
There should be no special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All relevant information. Especially if my provider is throttling service.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Disadvantaged communities, individuals, and organizations can only compete in a level way on the Internet. They will be just as disadvantaged in the online world as they are in the real world.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No throttling. It does away with a level playing field.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I see no good value arising from commercial practices, such as Zero Rating, which could shut out users like libraries, children doing homework, or anyone with limited financial means from accessing vital content like weather or news.

Is there a demand for specialised services? Which services should be allowed this special treatment? None I can think of.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Regulation of specialized services would inflate costs, increase Net traffic unnecessarily, and unduly infringe on Internet access to lower income end users. Regulation is like an economic apartheid and should be rejected.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell me as a consumer, in simple language, any time or usage limits on my ISP subscription, its cost, how its charges are derived, what subscription packages it offers, and how I can choose ways to manage my personal usage without granting the ISP access to my account and its not analyzing my Net use or content.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not interfere with my Internet usage.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, ISPs should not have monitoring privileges.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content

application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Joseph Cusimano

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I'm not sure, but I don't believe in interference.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Just enough to understand.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ZERO

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Eindeutig: Nein. Das ist Spionage. Mein Datenverkehr darf nicht überwacht werden, schon gar nicht die Inhalte. Was für das Briefgeheimnis gilt, muß auch hier gelten!

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität

verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Matthias Büchner

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It gives an unfair advantage to get zero-rated services!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Giving some traffic priority increases the cost of a new innovation being able to prove its large-scale potential.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No, all IP traffic is the same.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Eric Ashley

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have no interest in websites like shopping or sports however I am very active politically as well as with my non-profit. I could easily find myself "locked out of the sites that I use everyday and have unlimited use of sites I have no interest in.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely no ISP or Government should be monitor where I go on line or what I download/upload.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be allowed to restrict my ability to view any web site or its content. I am the membership Director for a small non-profit and we have all kinds of information as well as our members accounts on line. We could not afford to pay more money so our members can access their accounts.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Nothing discriminatory should be permitted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see no negative impact whatsoever on innovation and/or special services (you have not defined special services) from having an open Internet, unencumbered by throttling or fast lane distribution of access. If anything, throttling will only hurt innovation, contrary to false arguments made by some ISP and backbone providers. The tact to take should be to continue the development of increased bandwidth FOR ALL USERS and not the artificial meting out of access. The Internet is a utility, not the diamond trade. It should not be treated as a commodity.

Is there a demand for specialised services? Which services should be allowed this special treatment? How can this be answered without a definition of applicable "special services" Sounds like a preemptive loophole in the making.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. They should have no more privilege to a users content than a telecom service provider has to one's telephone. This is nothing but a tool to game the system for unnecessary profiteering.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

As little as possible, if at all. They must prove that it is in fact, technologically necessary.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

It would be useful for ISP's to provide a software utility or online method of gauging these matters.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Sven Severini, Tenerife, Spain.

**\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*** There is too much already. Internet is not television, and for sure not made for fast live streaming in HD.

Streaming over a company's network to end users should not be allowed to be privileged above any other streaming services. If content is not pushed to the end user, but pulled by the user from a computer, then it is internet, and privileges over other (similar) services shouldn't be allowed.

**\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*** Governments and public campaigns could pressure companies not to cooperate with groups or companies they don't like, e.g. political or social movements. Sites or Apps of companies or groups which are opposed by some influential players could have less access to a country's population. This harms freedom and democracy.

Many services of the future could and should be more like a peer-to-peer network. A bit like Bitcoin or Freenet-Project.

Information could be downloaded in the background and shared, all the time. This is even more difficult to archive if these services are slowed down by the service providers or if there are many zero-rating-users.

**\*Is there a demand for "commercial practices" such as zero-rating?**

Could these limit your rights as an end-user? Please provide examples.\* It would privilege services which are governmental friendly over privacy friendly services like Tor, Bitmessage, and any decentralised network. It generally privileges huge companies over smaller ones and over other alternatives. It's a coup against citizens, small companies, freedom and innovation.

**\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*** If it only manages the services I'm using then it might be okay. But I'm not sure if this could be misused for spying on me and store that information. In that case this technology shouldn't be allowed to be there in the first place.

**\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*** This is only acceptable if throttling of one service I'm using is being used to speed up another I'm using at the same time. Never ever to prefer the service someone else is using. Even then it should be used very carefully, since P2P could mean communication, receiving information, making payments, etc. I doubt that it is important at all. Maybe streams could be preferred to some extent.

**\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*** Of course all of it, in an understandable language.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry.

These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules.

Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Sven Severini

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

*\*Please enter your name/organisation\**

Jan Krämer

*\*Is there a demand for specialised services? Which services should be allowed this special treatment?\**

With the current infrastructure and infrastructural possibilities there should be no need for specialised services under any circumstances.

*\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\**

Not only would it obviously hurt the openness of the Internet if only big companies have access to the "hyperspeed lane" of the internet, but future innovation would stagnate heavily in my opinion. The competition would be greatly reduced if the financial hurdles to get preferred treatment from ISPs are too high for small and non-commercial webservices. Without this competition there would be no need for technological progress, therefore there can also be no intellectual growth in our society.

*\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\**

A good example would be the free internet campaign of Facebook in India. While it is an admirable effort to facilitate access to the world wide web for people who could not afford it before, it is questionable to reduce that offer to a few selected services. If Facebook had succeeded, it would have gained the power to dictate the Indian people where to get information from and what information they can get. This would rob them of their free will to gather information freely from several sources. This kind of censorship should never happen.

*\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\**

First of all in a neutral net the need for traffic management should never occur. But the ISPs (at least in Germany) already know how much traffic I cause. A further inspection of the traffic would be a grave violation of my privacy. This would be equivalent of the Deutsche Post opening my mail or packets.

*\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\**

The ISP should never prioritise any traffic. Again, prioritizing leads to an unfair market and creates a tendency for monopolies to emerge. This would greatly hinder technological/intellectual/cultural growth.

*\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\**

I would for sure like to know the speed of my connection. If the ISPs are applying any form of traffic management on my connection I also would like to know what kind of management they use and

most importantly why they think the management is necessary.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er

den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
M. Suppus

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Christian Düntgen

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No - that not only gives them power to discriminate against certain traffic types, but also is just plain creepy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None - packets are packets.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know exactly what I am getting before I start paying, which includes speeds, throttling, data caps, upload speed, latency, and censorship.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Inhalte von Datenverkehr dürfen nicht überwacht werden, da die Gefahr von Missbräuchen zu groß ist.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Karlheinz Hug

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The ISPs and some of the large established online "services" would probably think so, so they can extract more money from users. I can't think of any such requirements that users would want. This would seem to be cries of "scarcity", in the light of ISPs not investing in improving infrastructure.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If an ISP has fulfilled the demands (needs) of customers, and wishes to place additional (not diverted) resources to "specialised services" I suppose that might be ok, but I would be very weary of such as once in place the danger of "creep" would be a constant danger / temptation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. If I go somewhere and / or do something, I am entitled to do so in privacy, given that place is not public. Ordinary people (I suggest the very vast majority) do not consider their use of the internet to be "doing stuff" in public.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

If an ISP has to manage traffic for "good" reasons that's ok. Such management, would be open, transparent, exceptional, rare. It would be demonstrably UNrelated to profit. "Consumers" have paid and continue to pay ISPs such fees that the infrastructure of the IN should be considered the consumers right, which they have the privilege to facilitate.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Data collection and retention details, and what analysis are carried out on the data (including meta data). Information about the infrastructure of the IN (or my ISPs part / end of it). Business transparency.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No everybody's opinion should be confidential and private between seller and buyer.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A gateway for those with an agenda to push their own needs using power and stealth. Positively, I can't think of much.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Not really.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Everybody should mind their own business. What are they so scared of?

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It shouldn't be allowed to.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Who is spying on me, it's speed. That's all I need.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If the company in question doesn't feel like using "zero rating" for services I like, it is essentially a discouragement for me to use those services and as such a violation of net neutrality.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Regulation is fine when it is directed properly. This is not necessarily such a case.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No demand that I've heard of.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, not quite. I prefer my intimate moments to be my intimate moments.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Limited at best. As a singular person, I can say there are certain forms of censorship I'm not necessarily going to rage against, but prioritizing internet use by certain services, on the other hand, violates net neutrality and incurs the negative consequences associated with doing so.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

While it is fine to regulate businesses in order to make sure they provide certain types of information, it should be a more loose type of regulation when centered on smaller businesses, as they are unlikely to cause the harm associated with larger corporations, especially the monopolies for which the heavier regulation should be reserved.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Michael Hansen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Philipp Wellek

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The specialized services could be taken over by big corporations with self interest. Thereby the internet becomes bias.

Is there a demand for specialised services? Which services should be allowed this special treatment?

no

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. The internet should not be monitored. It must be a free media.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

no interference

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

if there are any limitations, I want to know them

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Sharon Wojno

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating could lead to monopolies within the content providers and an unhealthy power of the internet providers. For example, if the Deutsche Telecom zero-rates Spotify as a music streaming service, no one who gets internet access via Deutsche Telecom would choose an other music streaming provider.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

In no way

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I should have the information I need in order to make reasonable assumptions about the quality of the service available for my particular priorities (gaming, video, etc).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there is no demand and it would limit rights as an end user if the ISP is allowed to choose what I see or when I see it and the speed at which I see it

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I am not currently sure of any positives, but the negative would primarily be censorship

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, absolutely not

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Just the speed, quality of the network, and data packet mining is done and why.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No zero-rating. No special deals by an ISP that puts other services and competitors at an advantage.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The Internet will become an expensive nearly useless service when ISPs start charging to make more money by putting their competitors at an advantage.

Is there a demand for specialised services? Which services should be allowed this special treatment? ISP need to have sufficient capacity for their and competitor products. Otherwise the ISP will limit capacity and claim they need to charge more for competitors products. That is simply a lie.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

All internet services must be treated equally and free. There should not be any special pricing for advertisers and businesses to the detriment of others.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

An ISP should not be able to interfere with my Internet connection. No throttling. No slowdowns for competitors.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The ISPs must clearly tell all their service options and limitations.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Even if there is that demand cannot sacrifice the rights of others

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
Nepotism

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
No need for it as it could funnel customers into faster loading websites

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Never. Why should they have access to anybody's personal information or data that can reveal those. They sell a product.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Complete transparency. So all of it including data stored about searches done by myself

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Jim Thomas

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

?

Is there a demand for specialised services? Which services should be allowed this special treatment?

no

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

speed and quality

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Dr. J L Underfeer

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

NO - THIS IS JUST ANOTHER POWER GRAB BY BIG CORPORATIONS

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I cannot think of any positive impacts, but we want to keep net neutrality in America and everywhere else.

Is there a demand for specialised services? Which services should be allowed this special treatment?

NONE

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I WOULD APPRECIATE ANY INFO ON THIS SUBJECT

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine Sonderstellung für jegliche Dienste

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte.

Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Andreas Habermehl

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating commercial practices could limit my rights as an end user in not guaranteeing the best service.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No demand.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is no positive.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All the listed & maybe total usage for curiosity purposes.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Der Internetprovider soll meinen Anschluss nicht beeinflussen. Er soll Internet Providen. Und zwar das ganze Internet. Bitte.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Alexander Jacob

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Zero

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Alex W Boucher

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no legitimate use case for zero rating that doesn't compromise the essential power of the Internet. Zero rating is not worth the sacrifice of end user rights this practice entails.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
NO, and NONE

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE WHATSOEVER

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Bandwidth, speed, any and all details of what private information is retained (ideally none), any agreements made with competitors for geographic location, lobby effort disclosures, details of how traffic is managed, data caps (if any), punitive content restriction, etc.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Latenz, Traffic Management, Quality of Service

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien

Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Robert Miller

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There certainly is a demand for these 'services' and they do have benefits. It's great if a certain service doesn't count towards my data cap; I can use more of the internet for longer. On the short term, there are only benefits.

On the long term, however, zero-rating kills competition and thus stifles innovation. In the end, we'll be worse-off with zero-rating than without it.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

As I previously stated, discriminating between different services only kills competition.

Imagine a city where there's a fast food restaurant on a nicely paved road in the city center. Discriminating between different services would be like blocking other restaurants from settling on this road and only being allowed to build on the outskirts of town where only a dirty sand road is available.

A new restaurant looking to settle might have friendlier waiters and waitresses, better and cheaper food and a nicer looking accommodation, but due to the way there being horrible, almost no one will go there.

It is exactly the same when we allow ISPs to use zero-rating and other discriminative tools; new companies, ideas and services will have a major disadvantage over the already established companies due to being throttled by the ISPs, which means that innovation and progress will be a lot harder to achieve.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not at all. Privacy should be respected for anyone using the internet, and traffic should not be allowed to be monitored.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. I should be able to decide if I want to prioritise traffic myself, and what traffic to prioritise. My ISP should not interfere with my business on the internet.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Rens Huizer

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Michael Seibt, Chemnitz, DE

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\* Only voice phone connections, especially for emergency calls, should be prioritized over any other internet service.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\* If there were allowed single exceptions from neutrality, further parties would argue that they need an exception, too. This frontier would be moved and moved. That's why it shouldn't be opened.

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\* In the end, I would have to pay for a service, which was chosen by "my"

provider. What then if I would like to use such a service from a competitor? I don't want to need to switch to another provider because of an additional service. What if provider X prefers service A1 and service B2, and provider Y prefers service A2 and service B1, and I like to use services A1 and B1?

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No, not at all.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\* Not at all. If I want traffic shaping, I'll configure my router myself.

Most of P2P or synchronization service have their own options to limit the bandwidth.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I want to know

- the minimum and maximum speed in both directions,
- the quality of service including capacity of the connection to the backbone,
- and that the traffic won't be managed except for voice phone calls.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf für Zero-Rating. Zero-Rating könnte mich z.B. dazu zwingen, dass ich ohne Einschränkung meines Datenvolumens den Streamingdienst von Amazon nutzen könnte, obwohl nur Netflix die Sendungen hat die ich wirklich sehen will, somit müsste ich mich entscheiden ob ich nur eingeschränkt streame oder einfach nicht das sehe was ich sehen will, oder mir gar beide Streamingangebote kaufe. Egal wie ich mich entscheide am Ende kostet es mehr als ohne Zeroring.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich kann mir keine positiven Einflüsse vorstellen, deshalb bin ich der Meinung, dass die in der EU Verordnung festgelegten Spezialdienste möglichst streng definiert werden und nur Staatlichen Organisationen in Ausnahmefällen vorbehalten bleiben. Z.B. für die Organisation nach Umweltkatastrophen oder das Erreichen von temporär von der Außenwelt abgeschnittenen Regionen.

Für alle anderen Fälle sehe ich keinen Bedarf an Spezialdiensten, da diese einen fairen Wettbewerb verzerren.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Internet-Provider sollen meinen Datenpakete zum Managen des Datenverkehrs nicht überwachen können.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Mein Internet-Provider soll alle ein- und ausgehenden Daten zu meinen Devices neutral behandeln. Ich will selbst über meinen eigenen Datenverkehr bestimmen können.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und

nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Erwin Ernst Steinhammer

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Thomas Schranz

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Antoine Perrin

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

When we won Net Neutrality in the U.S., the FCC decided to enforce “zero-rating” on a case-by-case basis. That has been a disaster, with ISPs like Comcast and Verizon rolling out zero-rating schemes that punish Netflix and Youtube viewers.

Folks. This summer, we have a *\*huge\** opportunity. We can win real Net Neutrality in one of the world’s most important regions: Europe.

But if we lose, every Internet user in the world will feel the impact, as ISPs win more political power—and more control over their customer’s choices.

European regulators will finalize their guidelines by the end of August. They’ve published a draft, and there are some really bad loopholes. If we fix these loopholes, we win. One victory, 28 countries, and some of the largest markets in the world!

But if we don’t, telecom monopolies win the power to manipulate Europe’s Internet. Activism beat the telecom lobbyists in the U.S. and India. We can’t lose Europe. The comment period ends July 18. That’s just 39 days left to submit millions of comments to the EU for Net Neutrality. Let’s do this!

[Click here to submit your comment to EU regulators right now!](#)

You might not live in Europe, but what happens there this summer matters everywhere. This will influence net neutrality rule making around the world—including in the U.S., where the FCC is still deciding on zero-rating. And Europe is a huge market. If Europe’s giant telecoms can manipulate which sites get popular in Europe, that shifts the landscape everywhere.

The Internet gets more boring, more corporate, and less independent—for all of us.

On the other hand, if we win, other countries will have yet another reason to pass great Net Neutrality rules. America’s FCC will feel more pressure to ban harmful zero-rating plans. And the number of people (and businesses, and activists, etc.) operating in an unequivocally open internet will skyrocket.

You saw how we won in the U.S., by driving millions of comments to the FCC, paired with strong legal arguments. That’s how they won in India too. Now we desperately need to make that same internet miracle happen in Europe. So far, the number of comments submitted to BEREC is in the low thousands. Let’s add some zeroes to that number, fast.

Even if you’re not an EU resident, you can comment too. [Click here to submit your comment!](#)

The first loophole we need to fix is “zero-rating.” This is the shady practice of ISP’s \*charging you\* for Internet and then pushing/forcing you to use some sites by making them appear free, while charging you even more to access others. Zero-rating tilts the Internet towards tech giants, away from new startups and independent voices.

When we won Net Neutrality in the U.S., the FCC decided to enforce “zero-rating” on a case-by-case basis. That has been a disaster, with ISPs like Comcast and Verizon rolling out zero-rating schemes that punish Netflix and Youtube viewers.

We can’t make the same mistake in Europe. The right move is to ban any zero-rating that privileges one kind of site or app over others. Activists in India won this already. We can win in the EU too. But we need your help.

If we beat shady “zero-rating” deals between telecom & tech giants in the EU, that makes it easier to ban them everywhere. [Click here to submit your comment!](#)

The second loophole is about “traffic management”. The Internet isn’t just web traffic. There’s videochat, BitTorrent, games like Minecraft, and privacy tools that encrypt your traffic like VPNs and TOR. Good Internet providers try to make \*all\* of these services work as best they can. But the new EU rules would let Internet providers be lazy—or evil—and throttle traffic they don’t care about, or don’t like, even when there’s no need to. That undermines the very heart of the internet—the free flow of all information,

That’s a serious problem, for any app that goes beyond the web, whether it’s to protect privacy, let people communicate directly, or make the internet more decentralized and independent. Videochat. Games. Bitcoin. All of them are at risk. And if we win, all of those apps’ traffic will be protected from arbitrary slowdowns, forever! Europeans deserve as much access and internet speed as we have in the US.

Finally, the third big loophole is a familiar one. A subtlety in the rules would let ISPs offer “specialized services” in a fastlane that would cannibalize bandwidth for other services. We need to make sure that if an ISP offers a specialized service (like television), that bandwidth is in \*addition\* to whatever else people have. Otherwise it’s a fastlane. And that’s not going to help individual users.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No, this is a fiction created by ISPs.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any action that prioritizes business over individuals and sacrifices our privacy to commercial interests will attack the very reason for which the internet was created: the free and open flow of information among individuals. I see no positive impact from such actions; companies have shown over and over that they will not protect our interests when there is money to be made.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like clear, simple, uniform language that describes my rights and responsibilities, as well as the services provided and my options in regard to those.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, content is not their business.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only demand for commercial practices is by big corporations only. Steering me towards commercial (and heavily regulated) sites will only hurt my free choice to browse where and what I want. I should not be penalized for not sharing the same interests with largest focus groups.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The same as my earlier answer: The only positive impact is for big corporations only. Steering me towards commercial (and heavily regulated) sites will only hurt my free choice to browse where and what I want. I should not be penalized for not sharing the same interests with largest focus groups.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I don't mind if it is for traffic management only, but that is not what they are going to use the information for.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not interfere with my connection. Where and what I browse should be my choice, and not theirs.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Honest, up-to-date information on my speed and quality of service and not a commercial on what is theoretically possible.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Florian Horstmann

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I don't think there is a demand. People want good service, but they want to be able to choose their apps and services and not be forced into using the ISP's choice just to get good service. No service should be allowed preferential treatment. Fair competition brings us the best innovation, not monopolies!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Innovation will be squashed because small start-ups and new ideas will be unable to compete with the entrenched services that have already paid off ISPs to give them preferential treatment.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If ISPs are allowed to provide zero rating to their own services or services that have paid them off, it will provide them no motivation to give quality service to other apps and services. Users could be forced into using the ISP's services through sketchy service provided to their preferred apps. It's no different than "fast lanes", they've just found a sneakier way around.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should NOT be able to interfere at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would love to know my speed, quality or service, and how my traffic is managed. I would also like to see how my service compares to other customers and how my service using different apps compares.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Sure, there is probably a lot of demand for “commercial practices”. It is the perfect place to be able to pay a fee that I know competitors or up and comers wont be able to pay for.

This is paying at the other end for bandwidth that was already paid for by a) the customer and b) the webhost. Now, the ISP wants to get paid again by either the customer or the webhost. Classic ISP double dipping.

This hinders anyone trying to compete with a service that isn't as good but is already established in the market place.

What could be the positive and negative impacts of specialized services on future innovation and openness of the Internet?

The best case for a fast lane for specialized services would be for emergency or medical communications. All other non life threatening services should have to live with the poor bandwidth situation that everyone else gets. Ideally, these two services would operate on a separate network and often are.

The downside to this would be competitors not being able to compete against an established player. It would also end up costing consumers more. Companies would be purposely throttled or in the case of Netflix and Comcast in the US, ISPs would just not upgrade their networks to handle the traffic in order to strong arm businesses into paying for priority traffic. Those costs would then be passed on to the customer. There would become a point when it was just taken for granted that you had to pay ISPs for better traffic or you wouldn't be relevant. It's another classic example of ISPs trying to sell the same bandwidth twice.

Is there a demand for specialized services? Which services should be allowed this special treatment? I'm not sure if there is a demand for specialized services but other than emergency services, I don't see why it would be need or what benefit would come from it for consumers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know what my average bandwidth an ping are, how long my connection was up and how often it was down, and if traffic is blocked or shaped and how.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The only reason ISPs would need traffic management is if their network has more traffic than they can handle. Due to privacy concerns, I think it is very important to know that my ISP isn't using deep packet inspection. Traffic can be managed, if the network can't handle the amount of bandwidth the ISP sold, by throttling traffic on designated ports according to traffic type.

It is more important that skype packets don't get delayed than emails, which have default ports. There is no need for deep packet inspection and is just too much of a risk.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It is absolutely insane that an ISP should have to throttle traffic. they should only be selling as much as they can handle. If they oversell and start having too much traffic on their networks they should upgrade it. They shouldn't be punishing customers by throttling traffic that they paid for because they can't keep up with what they sold.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Of course there is demand - why compete fairly when you can just bribe service providers into offering access to your service on different terms than competing services?

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No and none.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all - if something constantly bogs down their network, their network simply isn't powerful enough.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Have you checked whether your Internet Service Provider (ISP) gives you clear, understandable and easily available information about its service? If you have, was the information clear enough?  
Perhaps not that much. BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Robert Markovski

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, eine Analyse des und ein Eingriff in Datenverkehre sollte ausschließlich zur Sicherstellung der Betriebsbereitschaft bzw. zu konkreter und akuter Fehlerbehebung zulässig sein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Sofern über eine gemeinsame Strecke mehrere, voneinander technisch getrennte Dienste geleitet werden (z.B. Internet-Anbindung \*und\* Telefonie über eine gemeinsame TAL), ist ein Traffic Management zur Gewährleistung der Verfügbarkeit beider einzelnen Dienste zulässig. Innerhalb einer Verbindungsart sollte keine Differenzierung zwischen unterschiedlichen Diensten und/oder Kommunikationspartnern stattfinden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen

wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Dominik Neubauer

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

?

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

?

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Of course no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
He could be able to take just 10% of my connection speed

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
real speed tests

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Reuben Rail

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, as an artist this would likely limit my ability to distribute my services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed, quality of service and better information on ping inconsistencies.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Ich bin nicht der Meinung, dass der Internet-Provider diese Möglichkeit haben soll

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Harald Puhl

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Philipp Krüger

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

No, there is no compelling reason to offer specialised services.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

There are no positive impacts.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

Zero-rating is unnecessary since networks are designed for peak load and not for average load. Volume based tariffs are the root evil here.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No, encrypted traffic will limit deep packet inspection usefulness anyway. ISPs should not be allowed to monitor my internet movements.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

Under no circumstances. This leads the way to censorship.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I monitor my connections speed and QoS anyway, my ISP simply needs to guarantee not managing my connection for me.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only demand that exists is among corporations. They WILL limit our rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is only negative here. Specialized services discriminate against the little guy, the equivalent of what we call in America "Mom and Pop" business.

Is there a demand for specialised services? Which services should be allowed this special treatment? Again, there is only demand among corporations and their interests. None should be allowed.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not at all.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no interference whatsoever.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive any and all information available. It's only right.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The bottom line here is that net-neutrality is the essence of democracy and freedom itself. If you deny net-neutrality, you deny these things as well.

Kind regards,  
Robin Sinyard

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I don't understand the problem.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
I don't understand enough to warrant an answer.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
I don't know.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
That's invasion of privacy.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Not really, some times I don't care.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All of the above.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich sehe für mich nur Nachteile. Gerade, wenn man beispielsweise den Sinn der Pressefreiheit tatsächlich nutzen will, sind Seiten von kleinen alternativen Medien wichtig. Diese zu benachteiligen kommt einer Zensur gleich.

Einem Startup-Unternehmen eine solche Hürde aufzubürden bedeutet zudem eine Verzerrung des Wettbewerbs zugunsten von Großunternehmen. Das wäre ein gutes Tool, um die Reichen noch reicher zu machen.

Das schränkt meine Wahlmöglichkeit ein und schreibt mir indirekt vor, was ich zu wissen und was ich zu kaufen habe.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

So oder so ist es eine Beschneidung. Neue Ideen müssen teuer bezahlt werden, um Spezialdienst zu werden, andernfalls werden sie schlichtweg untergehen.

Das Internet konnte sich als solches nur etablieren, weil es eine solche Klassifizierung NICHT gab.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Die einzigen Dienste, die in meinen Augen Sinn machen würden zu bevorzugen wären Katastrophenschutz und Notfall-Services, also für Dienste, bei denen es um Leben und Tod geht.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Alle Daten sollen gleich behandelt werden. Eine Priorisierung bestimmter Pakete schränkt sowohl meine Nutzungsfreiheit ein als auch ermöglicht es meinem Provider, mich besser zu überwachen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Sollte die Neutralität fallen muss mir mein Provider sehr genau erklären, was er wann und warum bevorzugt.

Weiterhin möchte ich Informationen über die tatsächlichen Geschwindigkeiten, wie viele Nutzer sich die Leitung, an der ich hänge, nutzen et cetera.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht dieser Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Dr. Heiko Hartmann

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

"Zero-rating" is an obvious scam which would allow providers to limit free and unrestricted access to all users.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positive impacts for "specialized services" for the general public, such provisions are only to allow the open internet to be controlled by those who would profit from so doing...

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no such demand in an open internet!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely NOT.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should be forbidden the right to interfere with a subscriber's Internet connection!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of the above

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Richard Fullerton

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

A special source of media might be free so that especially poor people get their information only from that source. Now there are lots of free sources of information to choose from if you can pay for data transmission or get it free without discrimination.

Also, newcomers with little capital could not afford to provide zero-rating like big corporations. Entering the market would be harder, monopolies promoted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

negative:

no investment into infrastructure: you need standard services to be bad so you can charge a good price for special services, more power and market share for corporations, worse chances for innovative newcomers discrimination to quality media that does not belong to a corporation more surveillance against political/ environmental/ human rights/ free press activists, getting molested by bullshitstories that I needed special services for google-cars and operations

pros:

none

Is there a demand for specialised services? Which services should be allowed this special treatment? Did I miss a specialised service? No. I will not in the future, either.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. If they watch my content, everybody can do it and will do it: CIA, FBI, German secret services and governments.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all - this is what net neutrality means. We do have the technical means to provide fast internet for all services, people and places.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Which third parties did receive data about me?

Has there been discrimination of data? Who exactly did profit or pay?

What was the average speed?

What and when did I have the lowest speed?

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. -----  
Madame, Monsieur,

Veillez prendre en consideration cette réponse des parties prenantes en regardant les lignes directrices de la neutralité du Net BEREC.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
Open internet is a step towards democracy

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Information services

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No. It is private data!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No throttling.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Joe Buhowsky

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Thomas Ganskow, Piratenpartei Deutschland

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Thomas Ganskow

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It is only positive when it helps to make the information on the internet more available for everyone. Specialized services that oppose the freedom of internet should not be able to use the internet

Is there a demand for specialised services? Which services should be allowed this special treatment? I can imagine that certain medical specialized services could be allowed special treatment. For example to get secure and speedy internet connection when serious operations have to be performed by a robot that is controlled elsewhere in the world. That deserves a special uninterrupted service without downfall.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No there is enough checking going on, I want to be completely free on the internet.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only when peoples lives are at stake ISP should be able to control the internet in favor of organizations that try to help the people in need.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would love to know every kind of information that is controlled by the ISP. Now it is unclear to my what information is sent over the internet from my computer to another computer and what information is controlled by the ISP.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Die Basisfunktionalität des Internet ist aus meiner Sicht ein öffentlicher Dienst wie das Stromnetz oder die Wasserversorgung. Wenn eine ausreichende Versorgung für alle sichergestellt ist, gibt es keinen Bedarf für zusätzliche "kommerzielle Praktiken".

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Mein Internet-Provider soll überhaupt keine Möglichkeit haben, bestimmte Datenübertragungen zu drosseln oder zu bevorzugen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Paul Schultze-Motel

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Discrimination is discrimination. Discrimination limits rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Freedom only allows and ensure sane competition and innovation. Specialized services is the same as discriminating, like it or not. You shut freedom and you shut innovation, competition at the same time, not to mention freedom of communication. Whatever happened to providing the people with real open access to communication? Why regulating it beyond forbidding hate or dangerous content? Money, greed. Let's keep it open and as free as can be.

Is there a demand for specialised services? Which services should be allowed this special treatment? Specialized services to everyone equally or none at all. Anyone deserves a suitably fast connection. Slower to some while others are granted faster is not acceptable.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Of course not. It's not their job to police our contents. They are service providing companies with infrastructure allowing the network to exist. They should aim at providing the best service at the lowest cost possible while maintaining a free speech channel as well as a market entry revolving door. Putting more control over it is the opposite of what they should be doing and can't act as a censure authority or traffic controller. As free and open as possible should be communication lines.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference allowed. Not their job to elevate themselves to playing God on our communication lines. Ending up deciding who should get priority is a form of censorship and is communist in essence.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As complete information as necessary and as clear as necessary to understand what my ISP is providing me with.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Sylvain Brosseau

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No comment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all! No prioitising of web sites should ever be allowed.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Have you checked whether your Internet Service Provider (ISP) gives you clear, understandable and easily available information about its service? If you have, was the information clear enough? Perhaps not that much. BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is

"transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP should not be allowed to look at the content and monitor my traffic on the Internet

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be able to interfere with my Internet connection at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Christopher McGraw

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating certainly is in demand - but from only a few users. The purpose of the internet is for the use of all people. Let's keep that purpose alive. It serves the people well. If zero-rating is implemented, my communications are inhibited unless I pay (bribe) to join a fast lane, and even then, it would be discriminately allowed or denied. Such control is not in keeping with the spirit and intentions of the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? There is no instance where specialised services should be allowed to overshadow the general use of the internet. It serves only the purpose and interests of a very few at the expense of the many. Does anyone have to say out loud how drastically unfair this would be?

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely not. It serves no valid, positive purpose.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
It serves no valid, positive purpose for them to do so. Such a scheme is only useful to harass, torment, arbitrarily control and manipulate people and small businesses which are the backbone of our societies. Who, in their right mind, would want to engage upon such activity? No one.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I pay for a service, therefore I am entitled to full disclosure of what I have purchased. That really goes without saying, doesn't it?

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Me, Personally

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

My name/organisation:

Mag. (FH) Petra Kröling

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir / Madam,  
Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Zeor rating limits competitiveness

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
They would curtail competitiveness which would stifle opportunity.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
never

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All the info.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context. The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It should be up to the end user what they want to see and not an isp. What gives them the right to discriminate, it should be about freedom of choice.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The only positive case I can see here would be for the provision of healthcare or emergency services contacts. Everything else should be treated equally.

Is there a demand for specialised services? Which services should be allowed this special treatment? As previously stated, healthcare and emergency services are the only instances I can see the need for special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

If you've nothing to hide I don't see why not. Provided any information they gain is used for no other purpose than traffic management and is either not stored or kept confidential.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I think they should be allow to throttle the speed of people who are using huge amounts of data at peak times in order to ensure that everyone gets a fair share of the bandwidth.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Average speed, quality of service relative to traffic management etc.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Im deutschen Festnetz, mit der derzeitigen Vielzahl an Anbietern und deren Tarifstruktur gibt es absolut keinen Bedarf für ein Zero-Rating. Im Mobilfunk kreieren die Provider den Bedarf an Zero-Rating durch Ihre Tarifstruktur selbst.

Viele Dienste sind mobil aufgrund überteuerter bzw. zu kleiner Datenpakete nicht nutzbar.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Neue/kleine Marktteilnehmer würden ausgebremst werden (indem Sie langsamer/schlechter nutzbar, teurer und somit unattraktiver wären als die marktbeherrschenden Unternehmen die mit hohen finanziellen Mitteln ausgestattet sind.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Auf keinen Fall!. Das wäre als ob die Postbotin immer erst meine Briefe ließt und dann (nach eigenem Ermessen) entscheidet wann/ob Sie diese zustellt. Ich will das mein Internetprovider meine Daten bestmöglich zustellt und nicht erst kategorisiert und dann entscheidet wie er Sie behandelt. Wenn ich Daten versende/anfordere will ich nicht durch den Provider entmündigt werden. Ich erwarte das er meine Daten in der vereinbarten Geschwindigkeit (ersatzweise bestmöglich) zustellt.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht. Wenn ich zum bespiel ein Backup über P2P anstoße oder mir Tutorial-Videos im Stream angucken möchte kann beides für mich extrem wichtig sein. Ich möchte dann nicht von meinem Provider (bzw. einem Algorithmus), der meine akuten Bedürfnisse nicht kennt, entmündigt werden. Mein Provider hat meine Daten (und die anderer) neutral zu behandeln und bestmöglich auf die Reise zu schicken.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte das Provider dazu verpflichtet werden Ihre Dienste nicht lediglich mit "möglicher maximaler Geschwindigkeit bewerben dürfen sondern auch eine garantierte Mindestgeschwindigkeit bzw, Durchschnittsgeschwindigkeit (ermittelt durch ein einheitliches durch die Regulierungsbehörden vorgegebenes verfahren) angeben müssen. Nur so kann ich mündiger Kunde sein und Angebote der verschiedenen Provider miteinander vergleichen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Daniel Demuth

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
no, only lazy ISP's not adjusting their network or backbone

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no, the idea of possible snooping in my data should be illegal

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
they shouldn't - I buy a product, they deliver to my needs, not for companies to buy dedicated parts of my connection

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
only a guarantee to deliver what I pay for

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open,

best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Lars Scheuerlein

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not sure.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Opportunity for one faction to have more time available than another.

Is there a demand for specialised services? Which services should be allowed this special treatment? Possibly some aspects of government.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of it

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Stephen Stoker

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for "zero-rating." And, in fact, "zero-rating" would limit my rights as an end-user. Two examples that come to mind in our battle here in the United States are Comcast's blocking of Bit Torrent and Verizon's blocking of text messages from NARAL Pro-Choice America.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't see a demand for specialized services!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

See mostly negatives - specialized services cannot be offered as a replacement for Internet access services. And price discrimination practices which offer access to a limited part of the internet negatively effect consumer's rights, competition, and innovation.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

We monitor speed, QoS, etc., on a minute by minute basis . . . .

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Zero!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No way!

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No and no.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Anything but a free and open internet will hurt competition and innovation and limit true free speech.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None. Except for 911 VOIP connections... Maybe.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'm paying for it so I should have access to how may data is used and tools to validate that I'm getting what I pay for.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Madame, Monsieur,

Veillez prendre en consideration cette réponse des parties prenantes en regardant les lignes directrices de la neutralité du Net BEREC.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Salutations,  
ionl

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

no

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

online-journalism

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services will hamper future innovations and the existing and invaluable openness of the Internet.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I haven't heard anyone I know express interest in “commercial practices” such as zero-rating. Why would we? These limit users' rights by charging them undue fees for using the internet and then masking certain websites as being free to access and others not.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs should not be allowed to monitor my traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management. This is an unneeded invasion of privacy that may slow internet speeds and of itself.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell users the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. Internet providers should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, users should be provided information regarding possible issues arising when they use VoIP applications, such as videos delays or sounds effects. Ultimately, they should have the information they need in order to make reasonable assumptions about the quality of the service available for their particular priorities (gaming, video, etc).

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be able to interfere with users' Internet connections - for example, throttling or prioritizing certain types of online traffic (video, P2P, etc). An equal and fair internet maintains an open, democratic space for interaction and information-sharing.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I doubt it.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"Specialising" can mean fragmentation, and ISP prioritising, to the detriment of the actual user.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I doubt there is a general demand. I can imagine some corporations wanting it, or possibly some social services networks. If it is genuinely in the interests of the people, then it is worth looking into. If it becomes just another cost exercise, then no.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Only if it becomes obvious there is a problem.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it, if I request it.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Where people have limited data, they w may be encouraged to access data that is filtered, edited, annotated, and less appropriate for their circumstances. Knowledge should never be the privilege conferred based on wealth.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

All knowledge is equal. No one website is better or worse, less, or more important than another.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No more than a 10% difference.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there is no such demand once people understand ramifications. In addition, zero rating could have a great negative effect on data caps and therefore exclude new and small players from the market.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services help certain large providers, and therefore make it harder for small providers to compete and/or innovate.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, deep packet inspection is only justified for security purposes.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Prioritizing streaming video, especially upload in video conferences and the like is important. Other prioritization is probably unnecessary or even a hindrance.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it, on a continuous basis and graphed.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Keine Spezialdienste.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Bin informiert.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann

nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
A.L.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Cultural content, etc

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
I don't know

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
I don't know

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Simple language

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
in amerika gibt es keine unterschiede : von anfang an ist dort das internet schnell, für alle bürger + bürgerin  
!!!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

jeder kann sein eigenes interesse verfolgen, indem eine eigene web - seite benutzt oder einen ganzen online - kanal betreibt.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
jeder, der einen spezial - dienst anbietet, stört nicht den rest der nutzer !

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein !

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
in amerika gibt es keine unterschiede : von anfang an ist dort das internet schnell, für alle bürger + bürgerin  
!!!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

ich will keinen unterschied zu dem maximum an erreichbaren, siehe USA !

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely not. All traffic should be the same to the ISP.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
I don't think the ISP should be able to prioritize certain kinds of traffic.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Mattis Deutch

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Cyrus Kube

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

None

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

It will destroy many Initiative with less money

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

No, I don't want to let the ISP choose, what's cheaper or not

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No, this is the beginning of censorship

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

Nil

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

all of it

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. In meinen Inhalten hat er nichts zu suchen. Das Netz sollte so ausgebaut werden, dass ein so geartetes Datenmanagement nicht notwendig ist, weil es Dank angemessen schnelle Leitungen keine Kapazitätsengpässe gibt.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Sehr gerne alle genannten Beispiele: Geschwindigkeit, Quality-of-Service und Traffic Management. Denn bisher sind die Angaben zu Geschwindigkeit äußerst schwammig und man muss sich durch eigene Messungen behelfen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht dieser Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist

besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Mit freundlichen Grüßen,  
Dr.-Ing. Mark Stamer

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

These "commercial practices" make the internet a discriminatory business, not an open platform. They are contrary to everything the internet and equal rights stand for.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It could be a death knell for the expansive internet as we know and envision it.

Is there a demand for specialised services? Which services should be allowed this special treatment? Maybe the question would be better addressed not as "is there demand," as there will always be someone(s) who want something. Maybe a better perspective would be what best serves all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Sandra Thompson

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich sehe keinen. Alles, was den Einen (Z.B. große Firmen) bevorzugt, benachteiligt automatisch Andere!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

(Bezahlte) Werbung im weitesten Sinne wird bevorzugt, andere Informationen benachteiligt bis zur faktischen Zensur.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Nein!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN!!!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
0,00 %!!!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich bekomme schon alles, was ich benötige. Weitere "Dienste" in der Richtung brauche ich nicht.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Thomas Strothjohann

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services cannot be offered as a replacement for Internet access services. Price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for "commercial practices" such as zero-rating. These limit our rights as end-users. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISP should provide concrete examples on how they manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. ISPs should state the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. Internet providers should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. Information regarding possible issues arising when using VoIP applications, such as videos delays or sounds effects should be provided. We should have the information required in order to make reasonable assumptions about the quality of the service available for particular priorities (gaming, video, etc).

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
clearly: no

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
A few years ago, I experienced first "modifications" to my traffic. It was a file for a college-exercise which was manipulated. For this reason I was not able to complete the exercise. Since this happened to me, I disagree to all "interferences" that ISP could do to my data.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Receive from who? I would like to know some detailed information, but I would not like to rely on information given by the provider. If possible, it should be somehow "independent evaluated"

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, I don't think so.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not interfere at all in my opinion.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf für Zero-Rating. Ich werde dann z.B. gezwungen Zero-Rated Services zu benutzen weil andere unabhängige Informationen möglicherweise schlechter zu erreichen sind.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Durch Spezialdienste werden unabhängige und freie Informationen werden schwerer zugänglich. Das muss verhindert werden!

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

provider-unabhängige (VoIP-)Telefonie, provider-unabhängiges Videostreaming

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein. Zum allgemeinen managen des Datenverkehrs ist keine DPI notwendig! Alle Datenpakete sollten gleich behandelt werden.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
garnicht!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Zugangsdaten um diesen auch mit anderen Geräten (Routern, Modems) nutzen zu können.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Sascha Ludwig

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Lawrence Tetenbaum

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Emergency services, police, fire, medical, etc. Educational services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Innovation will be futile, as everyone seeks only to save bandwidth with established companies.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It inhibits smaller start ups from gaining market share, since the established brands will always have an advantage.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None of their business what I do.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I don't need any information about my services, and my ISP doesn't need any information about me. There are websites already in existence that can give me whatever statistics I want.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Only if I can monitor the traffic of the management and executives of every ISP.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
ShieldsCW

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
There is no demand for specialized services. No service should be arbitrarily determined more necessary to have a better connection than another.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

All positive, keeping the internet open allows for everyone to roam freely with their ideas flourishing and competitiveness rampant.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no consumer demand for zero-rating. Commercial practices such as these only exist to make the companies more money and make our internet slower and worse, limiting the impact the little guy can have on the internet.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know what is being studied about my own habits so that I can make them stop looking into my privacy.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I think zero-rating has only a very small, if any, impact on a customer's decision of what ISP to use, but if I had a zero-rated internet service it might influence my decision of what sites to use (which is certainly the point). This harms my right to choose the best (privacy-respecting) services, a right the free-market is based on.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

All an ISP needs to do is route Internet traffic where I and other customers where we want it to go. They absolutely shouldn't do anything more than that as they 1) risks messing up Internet content, 2) invades my privacy, and/or 3) hinders competition between online services - and if the ISP charges enough they don't need to.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I'm fine with ISPs throttling or slowing down traffic as long as they don't specifically target certain sites. For example I object to ISPs prioritising YouTube over a new competitor, but if content is delivered over a protocol like UDP which reduces overhead that's a good indication that it should be prioritised. Also if an ISP needs to throttle connections due to load, it should do it to all connections in the area.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. Corporations already have too much power

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No one's content should be "Prioritized" - the connection is something that I pay for and I should not be inhibited in any way.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Frank Wagener

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein. Ich will selbst entscheiden. Wenn ich einen Suchbegriff eingebe, dann möchte ich alle Einträge, nicht nur die, für die bezahlt wurde.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
es können gezieht dienste abgeschaltet oder beschläunigt werden, egal ob ich das will oder nicht.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?  
weiß nicht

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein. Es geht niemanden etwas an, wo ich unterwegs bin. Ich möchte auch keine chinesischen oder türkischen Verhältnisse der Bevormundung.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
möglichst viele

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Uwe Mörtel

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

zero

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Laura Herndon

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Definitely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not interfere with my connection. I pay them very good money monthly and I expect free and open service in return.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I know nothing at the moment about the service I pay for. I'd like easy access to such information, eg speed, traffic management, access that is being blocked and why.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. ---

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Heike Habel

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have an online shop. This would severely limit my ability to conduct business.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

This would stifle innovation and competition from startups.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I disagree

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Online services must be free and competitive. Strangleholds should be barred.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Stifle innovation, permit price-gouging, destroy the free internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

What does "traffic management" mean? If it means speedy transmission, yes. If it means spying, accumulating information to sell to junk e-mailers, NO.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Ich sehe keinen Bedarf für kommerzielle Praktiken.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Die Einrichtung von Spezialdiensten hat meiner Meinung nach hinter einer allgemeinen Verbesserung der Internet-Infrastruktur und -geschwindigkeit zurückzustehen. Eine Sonderstellung wäre allenfalls für Dienste, von denen Leib und Leben von Menschen abhängen, denkbar.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
In äußerst engen Grenzen, etwa wenn der allgemeine Betrieb der Infrastruktur nach neutraler, externer und unabhängiger Expertise ohne den Eingriff gefährdet wäre. Ein solcher Fall wären DDOS-Attacken.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Ich möchte, dass mir sämtliche technischen Details und Parameter, auch tagesaktuell, offengelegt werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Florian Berger

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Only from companies that want to make more money, from what I can tell anyway. No one should be allowed special treatment except maybe some form of online emergency service dispatch.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The only positive I can think of is that people would be able to access certain websites a lot faster or at a higher quality, but it's at the detriment of other websites, companies etc. It will inevitably stifle important topics or information and make certain websites impossible to access. The negatives FAR outweigh the positives, even before we start talking about personal freedoms.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only benefit of zero rating seems to be big companies getting bigger whilst new companies are left in the void.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I don't think it should be able to at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much as possible.

I am already with a "third party" ISP and my service is easily understood, well presented, transparent and most importantly informative.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Chrissi Taylor

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any commercial practices which limit user’s rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available. ISPs should provide information on quality of services parameters in very clear language in all contracts.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Kein Dienst sollte Sonderstellungen bekommen. Wie schon geschrieben, sollte endlich die Bandbreite auf ein ausreichendes Mass ausgebaut werden.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Grundsätzlich habe ich nichts zu verheimlichen. ABER: Jedwede Form der Überwachung, Drosselung oder Gängelung KANN per se zur "Schere im Kopf" führen. Ich kenne dies noch aus der DDR und möchte es kein zweites mal erleben.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht. Deutschland ist ohnehin Internet-Entwicklungsland. Die Provider sollten endlich gezwungen werden, ausreichend Bandbreite für alle und überall zur Verfügung zu stellen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte EINDEUTIG, KLAR UND VERSTÄNDLICH alle Informationen vom Provider bekommen, die mir ermöglichen zu entscheiden, ob er das Geld wert ist, welches er verlangt.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Ralf Hartung

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? None that I can think of, and if there are they should not receive special treatment.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If a provider decides some news sources will cost you and others will not, the provider can steer opinions in every direction it wants by offering their preferred sources for free, while putting up pay barriers for others.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NOT! It's ME who defines what is important and what is not, not them.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No way! It's nobody's business what I or anyone else is doing on the Internet. The ISP's task is to pass the bits, no more, no less.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Ed Hyde

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Sascha Warner

If every service is treated equally, the general connection is quite good. Thus no special treatment is necessary.

Small startups are penalized because they cannot afford high fees required. A very good real life example of this already is Deutsche Telekom's attitude for peering. See the youtube dilemma.

This will limit the diversity of information because the sites you get for free will be preferred. This increases pressure on smaller sites and will lead to their closure, thus losing information. Losing information and diversity for me is a loss of freedom.

I do not want a preselection of those paying my ISP best. I want to be free to choose myself as I have done before.

Traffic management is only necessary if the ISP severely messed something up. Such as not having enough bandwidth or too much buffering (see bufferbloat). Also modern routers including self built ones include trafficshaping already.

Deep packet inspection is just one way of getting more data from me which is then used against me. Also see "Fernmeldegeheimnis".

It is not my ISP's task to monitor me. I pay them for delivering IP packets. Whatever might be inside is of no concern to my ISP. Transferring IP packets is his sole and only purpose.

I can measure these myself. I do not want any information regarding this from my ISP, because to do so, he has to measure and capture data first, which interferes with the "Fernmeldegeheimnis".

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Lotta Lille, citizen, Sweden

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

Necessary information from authorities - emergency messages.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Knowledge is building on knowledge, as is cultural expressions building on culture (think of how many plays/books/poems count their origin in Homer). Sharing is caring, and two brains think more than one. Not to mention what thousands of brains may think of. To find a cure for cancer, zikavirus or what-not.

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

There sure is a demand, but I don't see any reason for "commercial practices" to be used on highways, so why on the internet? The net is supposed to be an infrastructure as essential as roads, water or phone, and then it should not be hi-jacked by "commercial practices". Especially as the net is continually being seen, by authorities, as particularly important when it comes to defending civil society in times of crisis.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

It should not.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no such demand from consumers. Allowing zero-rating just gives the opportunities for ISPs to gouge prices if people go over the allotted data... this creates a chilling effect on any non zero-rated site.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Network neutrality is especially essential in the world of startups and small business. As you can imagine, neither AT&T nor Comcast were probably very excited about sites like Hulu or Netflix entering the marketplace. But thanks to neutrality, users are able to access them at the same speed as everything else. If Hulu or Netflix had to pay Comcast (and get their blessing), they might never have come to be. Or they might have been only able to pay Comcast but not AT&T for “premium” speeds, leaving the services reliably available to some users but not others. Once again, cable providers would be choosing which programs we see. The freedoms and competition sparked by the internet would be extinguished.

From my Op/Ed in Comstocks Magazine.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like BEREC to report to consumers all types of information it deems necessary.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be allowed to interfere with my Internet connection in any way.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become

less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Ronald Matthews

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It is mostly used by companies to reduce the cost of services they own stakes in and make competing services more expensive.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

It should be restricted and anonymized if available at all.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

no

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There isn't such demand. Our right must not be limited.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If specialised services violate Net Neutrality, their impact would be negative

Is there a demand for specialised services? Which services should be allowed this special treatment?  
On services which not violate Net Neutrality

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, privacy have to be respected

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Nothing

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I like receive information about speed, quality and neutrality

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,  
Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
David Seyboldt

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf für "kommerzielle" Praktiken! Meine Rechte auf freien Zugang zum Internet werden eingeschränkt, so geht das nicht!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Beeinträchtigung des Internets, preisdiskriminierende Angebote!

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
M.E. gib es keinen Bedarf für Spezialdienste. Die Bedarfsträger für Spezialanwendungen verfügen über eigene, in sich geschlossene Netze!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Bernd Schuller

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating is not equality and not in the spirit of net neutrality. There are no real justifiable reasons for data limits in the first place and the whole practice of increasingly implementing those is immoral. Thus zero ratings should not be a matter of contention in the first place.. however, there could be very cheap connections which specifically allows being less prioritized and having a monthly limit but should be duly advertized as such.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Fast lane practices are not only dangerous to freedoms and net neutrality but perhaps even more importantly potentially introduces a new dangerous element in stock-market trading. The company using robots having the fastest lane wins and buys/sells first, this is probably abusable introducing another unfair advantage in markets.

Is there a demand for specialised services? Which services should be allowed this special treatment? Perhaps for the https protocol for the availability of banking/payment services and such. Introducing fast lane for market bidding is dangerous however as previously stated. Throttling could be allowed if network load is demonstrably temporarily too high, deep packet inspection should not be allowed without heavy regulation as previously stated. ISP should be ready to handle the loads > 95% of the time.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. If need be only the protocol used. Any deeper inspection of packets amounts to the same breach of privacy/freedom as opening your physical mail/packages, no more no less.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No more than necessary to maintain network stability. There are legitimate uses for P2P, VPN and encrypted communication for instance and getting the speed offered by the ISP is the right of the consumer no matter the service / protocol used. IF network load is 100% and other service really are being affected THEN it could be allowed to prioritize for instance http/https over p2p. Packet inspection however on any level above filtering from the type of protocol used should not be allowed without court order and in cooperation with law enforcement since this amounts to a breach of privacy/freedom on the same level as of opening people's postage packages. Period.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Basically real speed, quality of service or how your traffic is managed should be made clear for the user in a short, simple and understandable description of the service providing links to more information about it. Currently, throttling and even packet dropping discriminating certain

traffic/protocols seems to be common too and are not sufficiently noticeably stated on pages / agreements at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Tommy Söderlund

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Alexander Weiß

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

Even car producers say that they don't need specialised services for their navigation. Until now, no company NEEDS special services, not even hospitals, fire departments or police stations. Even if they need it in the future, a better way is to build new infrastructure for fast internet than to make everyone pay for fast lanes.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Right now, I don't see positive impacts. Most companies don't want that and of course most customers either. They have to pay more for special services and only big companies can afford to buy such fast lanes. For the customer it means that there is the possibility that services they use every day will be limited in speed and comfort. Most of all, it's the industry who decides what should be a special service and what not.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

Of course not! it should be illegal to monitor the content of my traffic. It's private and it should be like that. I mean we live in a time where we get monitored all day and most people change their behaviour instead of demonstrating for more privacy. That is a very bad evolution and has to stop.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

The internet was born free and should stay like that. It's a basic principle and there is no reason to change that. Most arguments for a throttling is nonsense and hides the moneymaking reasons behind it. So the ISP shouldn't be able to throttle at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Kommerzielle Praktiken verleiten nur zu mißbräuchlichen Handlungen der Industrie, wie aus vielen Beispielen ersichtlich. Kommt die Politik der Industrie entgegen, wie z. B. beim "Minijob", dann entsteht daraus gewerbsmäßiger Mißbrauch dieser Regel, die eigentlich "nur Spitzenabbau" bewirken sollte!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Gerechtigkeit - Gleichbehandlung - Zufriedenheit!

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein, jeder hat sich an Gleichbehandlung zu halten.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, meine Privatsphäre ist mir wichtiger!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Keine zusätzlichen Drosselungen, da es bereits genügend vorhandene Auslastungs-Drosselungen gibt, die erst einmal beseitigt werden müssen!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Reale und nachweisliche Geschwindigkeitskontrolle, damit die Preis-Leistungssituation nachvollziehbar ist.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Peter Behrendt

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Only among commercial providers, not consumers. Zero rating, for example, undermines consumers and startups by limiting their ability to distribute services and products.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Prejudicial use of any limited resource necessarily favors one group or groups while neglecting another or others. In the case of the Internet, "fast lanes" would benefit the "haves" -- e.g., large corporations -- while limiting the "have-nots" -- e.g., consumers, startups -- from engaging in communication, competition, and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Yes: emergency services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All information that permits consumers to make educated choices about which providers to use (e.g., connection speeds, traffic management policies) should be given to them by providers -- and given to them in clear language devoid of technical and legal jargon.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Its very likely that a "zero-rating" would hurt audio and video streaming services that are just starting out, and would make a walled garden.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, nobody should have the ability to monitor traffic on the Internet, the only exception might be if a warrant is issued, and with a very limited scope.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No ISP should ever interfere with a connection in any way.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know about more about privacy issues, retention of log files, types of information in stored log files, who has access to log files, maybe possible hacking attempts against an account.

But traffic management, average speed, quality service at different times of the day, data caps, and any information on service limits are also very important.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Only life saving services should even get consideration for something like this.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would make the internet "pay to play" so only companies that had large sums of capital could utilize it fully.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ALL OF IT

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none for any reason

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Very little

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All the above

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
fabio massimo antonucci

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is always a demand for crony capitalism and it will always limit end users from using small new sources and give large established companies an unreasonable and unfair advantage over newer ones.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all, aside from limited QOS rate limits imposed due to network load on all customers on a network equally. The minimum speed should be contractually enforceable on the ISP by the customer.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Chris Heintz

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
none

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Mir ist kein Bedarf für "kommerzielle Praktiken" bekannt. Jedoch bin ich davon überzeugt, dass etwaige Praktiken einzelne Rechte als Endverbraucher beschränken könnte.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste könnte die zukünftige Offenheit des Internets erheblich einschränken. Durch Spezialdienste könnten sich große bestehende Dienste von neuen Startups abgrenzen und ihnen den Einstieg in eine etablierte Internet-Ordnung erheblich erschweren, wenn nicht sogar verwehren. Da große Dienstanbieter viel mehr Kapital haben und durchaus entsprechend Einfluss auf ISPs, besteht die Gefahr, dass sie selbst als Spezialdienste deklariert werden und so die Innovation ausbremsen, da sich Startups den Status als Spezialdienst womöglich nicht leisten können und so bereits zu Beginn zum Scheitern verurteilt werden.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?

Die einzige vorstellbare Berechtigung zum Spezialdienst und nur unter sehr hohen, strikten Auflagen wären meines Erachtens, medizinische Eingriffe die übers Internet durchgeführt würden. Dieser Spezialdienst sollte aber nicht dem Allgemeinbürger zur Verfügung stehen, sondern ausschließlich von öffentlichen Einrichtungen wie z.B.: Krankenhäusern etc. buchbar sein.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Meiner Meinung nach ist der von mir produzierte Datenverkehr streng persönlich und sollte unter die Datenschutzregulierungen für personenbezogene Daten fallen.

In einem freien, offenen und leistungsfähigen Netz (Internet) ist eine Inspektion eines Datenpaketes/Datenverkehrs zum besseren Management nicht notwendig, da bei einer Gleichbehandlung aller Pakete keine Diskriminierung und Benachteiligung einzelner Dienste vorliegen kann. Sollte das Internet trotz Gleichbehandlung aller Pakete an etwaige (Kapazitäts-)Grenzen stoßen, so liegt das an den weniger als unzureichenden Investitionen und der unüberlegten Förderung von bereits heute veralteten Technologien (z.B.: die Förderung und Ausbau von Vectoring etc.).

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Mein Internet-Provider sollte einzig und allein dazu befähigt sein, mir einen ungedrosselten, ungefilterten und überwachungsfreien Internet-Anschluss zur Verfügung zu stellen. Jede Möglichkeit einzelne Dienste zu bevorzugen oder zu behindern sollte vollständig und ohne Ausnahme verboten werden. Auch Internet-Anschlüsse mit begrenztem High-Speed-Volumen sollten jedem ISP verboten werden.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Garantieren Mindestdurchsatz (Garantierte Internetbandbreite) [Geschwindigkeit], Etwaiger Maximaldurchsatz (Internetbandbreite) [Geschwindigkeit], durchschnittlicher Internetdurchsatz meines Internetanschlusses [Geschwindigkeit]. Genaue und exakte Erklärung, wie der ISP Filesharing von normalen Internetdiensten unterscheidet. (Einige Anschlüsse drosseln die Leitung nach Erreichen eines Filesharing Volumens von x GB pro Tag) Wie steht mein Vertrag (Geschwindigkeit) in Relation zur durchschnittlichen Bandbreite die in Deutschland/Europa/International angeboten wird. Wie zukunftssicher ist mein Vertrag bzgl. Anstieg des Datenvolumens über die Zeit. Wichtig ist zudem die Angabe einer durchschnittlichen Latenz und die Angabe einer garantierten maximalen Latenz von/in Internetdiensten.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht dieser Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbare Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Diensteanbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu allen Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystems.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider

einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Mit freundlichen Grüßen,  
Thore Hendrikson

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

From my point of view are commercial practices efforts to gain advantage over other marketeers.

My name/organisation:

Georg Peters

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

There are no services / products known to me, that some how justify so called "specialised" services based on the internet protocol TCP/IP.

The only reason for such services were profit optimization strategies of ISPs by offering different type of products (fast lane, slow lane / price discrimination).

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Simply NO! From a information security point of view (my profession), it make no sense to rely critical services on unreliable protocols like IP.

IP is a bad choice for time critical applications. You allways need additional protocolls to create more reliability or choose a real direct line / virtual circuit connection.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Creating artificial barriers in a market allways lead into less competition and higher barriers for the market entry till up to new monopolys. That is the opposite of the success factors of an open Internet.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Zero-rating one service like music streaming of one provider eliminates the market of music streaming. This leads into higher prices of music streaming ("producer surplus" in monopoly theory).

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Yes for the traffic as traffic, No for analysing content. In protocol

speech: Yes they may analyse IP header, but must not analyse higher protocols or content.

It is like the traditional post office. They read the envelope, but must not open and check the content of the letter.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not at all. If I need to prioritise traffic, that means my line to the provider is full. This can be managed by my one devices (e.g. home router). The network of my provider must not be full, because he sold the bandwidth to me! Of course do the provider over provisioning (like airlines), because they expect (calculated) that not all customers will use all bandwidth. If this happened, then the market should find a provider, who is not over provisioning so much. If we have a monopoly / oligopoly, the regulatory authority must step in.

Provider sell bandwidth, they should have enough or sell not so much or rise prices, but not create new markets by reducing bandwidth.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, absolutely. In a private and a business way. Why should my data be discriminate from others data and transported in an other way? This opens a gate to broadmiss use of communication ways, what allready happened in past.

What would you consider to be "reasonable" traffic management measures?

How can "unreasonable" traffic management measures affect you as a users? Please, provide examples.

Reasonable traffic management (prioritising traffic) can only happen on the last mile between my ISP and me, so I can structure my bandwidth. Why should my paid traffic be deprotised against traffic from other users?

What information would you need to make an informed decision about your Internet connection?

For example: traffic management; commercial practices or technical conditions?

Bandwidth, connection protocol and credentials. I expect to have no management and no commercial practices in place.

What information would you like to receive about the speed of your Internet connection?

Bandwidth and maybe latency to reference points in the Internet.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

This is a difficult question, because the average Internet user does not understand most of these parameters. In addition this parameters changes over the day, week, events and destinations. But there is on thing, that must be described: The ISPs should explaine, how the sold bandwidth is shared with other users.

A DSL is usualy not shared, a cabel connection is shared with others in your street and a mobile connection is shared with others in the area. A 100MBit/s LTE connection ist not the same as a 100MBit/s DSL connection.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Georg Peters

Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? There really is no demand for specialised services for us consumers in the US. Those I have spoken to who live in nations within the EU and the UK both don't have a specific demand for specialized services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It could provide means of censorship. If ISPs want to favor their own interests and services and affiliates, it's very likely that could extend to things they want you to see politically, socially, and so on.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Many people don't want this. They want to be able to make their own choices on what they view online - say, Netflix or Amazon Video. However, US ISPs like Comcast favor these less, and throttle their own internet video providers (like Hulu, which Comcast has a stake on, or their own internal internet video/TV offerings). People should be allowed to have fair, fast access to the content they want, and, things like Comcast or Time Warner/Charter does like that, I want to jump to another ISP - alas I can't because Time Warner/Charter and Comcast both own a good chunk of ISP/TV markets here in the US.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I think they should focus on making everything as fast and as fair as possible. Instead of throttling certain internet data or data types, they should be focusing on bettering the infrastructure in your jurisdictions, upgrading old cable to fibre optic, and allowing cooperation with companies to work and offer fair reasonable competition and prices. Here in the US, that's a major problem of our own - companies will not allow any overlap, and monopolies are in many markets, and their infrastructure is unreliable, and outages are common in some areas. If the EU takes notice of this, this is not good for the consumer, and can also hurt the government - say in the instance of security of your nations, communications could be hindered by a bad infrastructure.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. I don't believe the ISP should be allowed to monitor any traffic, unless with a warrant through the jurisdictions involved for dangerous criminal behaviors.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All the information that is possible.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Überwachung!

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Kein Bedarf !

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein !

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
mein Provider soll sich raushalten !

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Alle Informationen die mich betreffen!

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
andreas moosdorf

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices should not restrict end users. No priority to companies who would be able to pay more for the bandwidth.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"Fast lane" is no good for regular users.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir or Madam,

please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Florian Reichl

Is there a demand for specialised services? Which services should be allowed this special treatment?

It is the end customer who pays for his or her bandwidth. One should get what one has paid for.

Telecom companies should not have incentives to lower the speed of internet access.

Perhaps we should change the billing and pay for Internet usage by volume. That does not have to be expensive. For example the German company Hetzner sells Internet traffic for 1.39 € per terabyte.

Zero-rating distorts the market and adds barriers to new market entries. Thus it stifles innovation and competition which is no good for customers and no good for the competitiveness of Europe as a whole.

I don't think it is necessary and I am afraid of abuse of it for anti competitive behaviour of the ISP.

Let's pay a fair volume price like 1.50 € / terabyte.

Since I do not want traffic management I would not need information about it.

All information about the internet connections and tariffs should be collected in a centralized data base that is accessible to users so that they can make an informed decision when choosing an ISP.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Emergency preparedness? 911? Weather disasters?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Better products could fail to be adopted because inferior tools are free of charge through market domination and loss-leading. Example: Internet explorer's destruction of Netscape web browser. IE led the pack despite its lack of technological development.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't doubt there's demand for this, given the very very high prices American ISPs charge for even our pokey bandwidth.

It may be important to ensure that proportional fees be available to pay to ISPs for all content providers to provide free content. A tiny web site could pay to distribute some content free based on bandwidth used. censorship by pricing out smaller rivals potentially produces public deception by providing one side to debates.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

As much as it likes with clear notification of when and why it will do so in its contracts with minimum 18 type font. No one source's traffic being throttled in an effort to censor it, however. Only types of data. Slower video? Fine, slow down MSNBC and Fox equally.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Limiting factors like cable's tendency to slow down when multiple users are using their connection. Bandwidth limits at a single point like a cell tower. What percentage of time one can expect optimal bandwidth. The average bandwidth one gets. What geographic considerations affect the predictions.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

As much as a mail service should be allowed to steam open envelopes and read your letters, sure. What's the difference as long as the mail goes faster?

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I'm not aware of a demand for "commercial practices" such as zero rating. These commercial practices will infringe on and limit my rights as an end-user through restricting my access online and any commercial practices which limit my user rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein, es Bedarf keinen Spezialdienst. Es bedarf höchstens ein Ausbau der Internetleitung.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Das das Internet immer teurer wird und wenn man nicht möglichst viel Geld investiert, dann ist man eingeschränkt und benachteiligt. Gerade in der heutigen Zeit wo immer mehr Wissen aus dem Internet statt aus den Büchern bezogen wird werden auf diese Weise Kinder die nicht in Familien leben die wohlhabend sind benachteiligt werden in Sachen Bildung.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es existiert beim Endverbraucher kein Bedarf an Zero-Rating! Selbst wenn es eingeführt wird werden die Endverbraucher es schnell merken bzw. irgendwann aufwachen wenn wieder ein Fall in den Medien auftaucht wie der von Edward Snowden und versuchen dagegen an zu gehen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Vom Grund ist die Idee löblich den Datenverkehr somit besser "managen" zu können. Aber wenn es nur für die "allgemeinen" Daten gilt und nicht für alle und da dadurch meine Privatsphäre gefährdet ist, bin ich dagegen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Die tatsächliche Geschwindigkeit und die Ausfallsicherheit sind das einzige was wirklich relevant sind. Andere Daten wie z.B. Traffic, Ports etc. sollten auch zugänglich sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre

Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

mit freundlichen Grüßen,  
Tim Stelling

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Wenn vertraglich eine solche Vergünstigung vereinbart wurde, verlöre ich, wenigstens während der Laufzeit, die Freiheit bestimmte Gruppen an Programmen ohne Vor- oder Nachteil zu wechseln. Ich müsste mich also in meinem digitalen Nutzungsverhalten mittelfristig festlegen, beispielsweise auf einen E-Mailprovider, dessen Daten zu Nulltarif abgerufen würden. Dadurch verlöre nicht nur ich ein gehöriges Maß an Offenheit, sondern auch neue, kleine und womöglich innovative Dienstanbieter, deren Marktzugang noch schwerer wäre, als das bereits jetzt der Fall ist.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Ich könnte mir einzig vorstellen, dass förderungswürdige Hoheitsbereiche (Bildung, Gesundheit, Wissenschaft, etc.) von herausgehobenen Spezialdiensten profitieren könnten, allerdings ohne dass dieser Zugang durch einen Marktmechanismus reguliert würde. Diese würden dann zwar bevorzugt, jedoch geschähe dies im öffentlichen Gesamtinteresse und nicht zum Besten zahlungskräftiger Einzelakteure.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Ganz sicher nicht, denn auch informationelle Freiheit ist Teil dessen, was wir als Privatsphäre schätzen gelernt haben.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Die Informationen, die eine angemessene Einschätzung und einen Vergleich möglich machen, also alles, was konkret und empirisch von Relevanz ist.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das

Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for "commercial practices" such as zero-rating. These practices could limit my rights as an end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can see no positive impacts of specialized services on future innovation and openness of the Internet. The negative impacts are many.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand for specialized services. No service should be allowed this sort of special treatment.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive as much information about my internet connection as possible, including its speed, quality of service, and how my traffic is managed.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to interfere with my Internet connection at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The ISP should not be able to monitor any traffic or content in any way for any reason.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Zane Mammon

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No zero-rating

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Protect freedom of information

Is there a demand for specialised services? Which services should be allowed this special treatment?

Yes

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Should not be able to interfere

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content

application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No. Imho zero-rating could lead to distorted competition, because a zero-rating service would be used more often, although another service might be better (more functionality, better usability, ...).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Hypothetically, there could be a positive impact for emergency services (eg. an emergency call) if such services would be prioritized. But in practice such emergency services don't need much bandwidth, and therefore wouldn't be much faster (if at all).

On the other hand prioritization of services could lead to an increased usage of prioritized services. This would distort competition.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No, because emergency services won't use much bandwidth.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, because it would slow down the packages.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should not be able at all to interfere with my Internet connection.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes and Yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I think negatively they will result in tiered service with the poorer people at the bottom.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I do not know.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be allowed to interfere.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know all of this information.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
There's no demand for such services and none should be allowed special treatment.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services allow internet providers, private institutions and even governments to censor and limit free open access to content on the internet and are therefore an obstruction to innovation and freedom of speech.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There's no demand for such "commercial practices" for the consumer/user side and it can only affect them negatively. The end-user should be able to decide what they want to access. By setting such practices that decision is controlled by the internet providers and private companies instead.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Internet providers should be clear and transparent about how my internet service traffic is being managed.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
João Campos

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for so called "commercial practices" because they will limit my rights as end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The negative impacts will be less freedom of communication, less competition and less innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't see any demand for such so called "specialised services", so there aren't any service that should be allowed this special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Nützen tut es nur den Konzernen. Außer lebenswichtigen Diensten, wie wenn Ärzte über Robotern an einem anderen Standort operieren, braucht man keine schnellere Datenverbindung.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Abkassiert würde bei den Ärmsten. Unternehmen profitieren. Diese Politik bringt den Parteien so viele Stimmverluste.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Lebenswichtige Ops per Roboter z.B.. Der Rest kann mit der normalen Geschwindigkeit arbeiten. Selbst Spiele brauchen keine schnellere Verbindung.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Wo immer man noch gläserner werden kann, sollte man geschützt werden, bzw. sich schützen können.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Über welche Knotenpunkte die Verbindung geht und wer unter Umständen Zugriff/Einblick in die Daten hat.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von

Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Stephan Vogel

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ein bedarfsgerechter Ausbau der Leitungskapazitäten macht eine Bevorzugung von Spezialdiensten unnötig.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Auf keinen Fall

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Felicitas Wilcke

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Definitely no.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is a demand among ISPs and corporations/developers hoping to engage in these types of pay-for-play contractual agreements with ISPs, but not among the consumer base. This could certainly limit my rights as an end-user. For instance, Mediacom could engage in a contractual agreement with CBS to provide an app for content that would be zero-rated while continuing to track data for video sites like YouTube or Dailymotion.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

These types of services could help up-and-coming app developers get more business and get the word out about their app when another app has been in the market for longer. However, this would also have a negative impact because it could lead to unfair advantages in terms of competition. It could also limit freedom of speech inasmuch as a video app could have certain advertisers buying bandwidth with them so their message would get out as opposed to a competitor who did not advertise with a zero-rated app. As such, this could negatively affect competition in other industries.

Is there a demand for specialised services? Which services should be allowed this special treatment? Perhaps public services, such as weather or PSAs

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive download and upload speeds, information about when updates and repairs to servers will occur, and what kind of information my ISP will retain and for what purpose.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, this is not necessary for traffic management. They only wish to collect marketing data and invade customers' privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should throttle only after a data overage beyond the contractual limit.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating means someone else is buying the right to pre-empt all other users. If they want their own network, they can build their own private network. If they get the advantages of working on the public network, they can have its disadvantages, too.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Only with a specific warrant.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They can slow it down if it is necessary to slow down all but emergency channels.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Adele Gleason

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Pierre-Yves BEL

I am working on some connected health applications. Some of them require the best connectivity to make sure the user will not be left without service when in need.

However, I have never seen any problems with current services. Problems arise from lack of coverage (for mobile networks) or network failure (for fixed access) but when the Internet access is working, there is no need for the traffic from the app to be prioritized in any way.

However, if some big health company were to provide services with some kind of priority, they could use this as a marketing edge (even though in reality it has no impacts). Competitors unable to meet the demands of ISP for specialized services (such as smaller actors who cannot afford the price the ISP would be asking for it) would then be at a disadvantage.

For the end-user, it would raise the cost of the service for no useful reason.

As a user, I am strongly against zero-ratings. I use few widespread Internet services and rely on less common alternatives. This means that my Internet usage is never covered by the current zero-rating offers, which means in the end that I am paying extra for not using the same thing as everyone else.

This means that this insidiously add an extra cost to the smaller actors, raising cost of entry to the market, and making it harder for small innovative companies to disrupt the market.

I have a master in IT and networks and I see no reason why Deep Packet Inspection would help traffic management. However, DPI is a clear threat to privacy and democracy. It can easily be used for censorship.

I do not see how reading a letter could help the post office manage the mail better, and even if it could, this would not be worth the cost in privacy, freedom and democracy.

Throttling or prioritising does not mean providing a better service. It means providing a better service for some users at the cost of the experience of other users. Current network technologies are good enough to optimize traffic. If some users cannot have a good experience, then it means that the network capacity is not big enough. Throttling would just be a band-aid that would hide the problems for some users while making it worse for others.

I can test the speed and witness QoS myself. What I cannot know is if some websites or services are being prioritized (or limited) or if I'm getting a degraded/improved experience compared to other users. This is the kind of information that I need to get from my ISP.

For example a French ISP used (or maybe still does) limit access to Youtube. Since it was not explained anywhere (not even acknowledged by the ISP), most users just thought that their connection was not good enough and that they had to switch from DSL to optic fiber, even though DSL was actually enough for their need.

This doesn't mean that it would have been acceptable if they were transparent about it. We know from current advertisement about mobile network coverage or Internet connection speed that ISP are masters of deceitful advertisement. In France most of the ISP have also been judged guilty of price fixing many times. Because of this, I don't expect the customers nor the market to benefit from allowing ISP to break net neutrality, even with guarantee of transparency.

Kind regards,

A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no customer-centric demand for "commercial practices". They would simply increase corporate profits at the expense of customer rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No. A case could be made that public safety and information, such as Amber Alerts should get higher priority. But that requires very little bandwidth. However, opening the door for that type of stream, establishes the capability, and thereafter could be misused. So, not providing the "specialized services" at all is a better route.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Alan Schwartz

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Other than raw data usage rates, no.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, it shouldn't.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, except for repairs to the system.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREK Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Es gibt keinen Bedarf solche Praktiken einzusetzen.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Jede Einführung von Spezialdiensten bringt einem anderen Nutzer Einschränkungen. Durch jedes Kabel kann nun mal nur eine Begrenzte Anzahl von Daten pro Minute geschickt werden. Sobald man da eine "Überholspur" einrichtet, werden alle anderen Nutzer dieser Leitung automatisch ausgebremst.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?

Niemand sollte eine Sonderstellung bekommen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Mein Internet-Provider sollte mir die durchschnittliche Übertragungsrates des Anschlusses ebenso mitteilen wie die höchste und niedrigste Rate, und das in einer benutzerfreundlichen Weise, zum Beispiel in einem Diagramm oder einem Musterbild. Das bedeutet, dass mein Internet-Provider die maximale Übertragungsrates nicht so darstellen darf als sei sie ständig zur Verfügung, denn das wäre eine Falschaussage zur tatsächlichen durchschnittlichen Datenübertragungsrates.

Internet-Provider sollten in allen Verträgen klare und verständliche Aussagen über die Parameter der Quality-of-Service machen. Es sollten auch konkrete Beispiele angeführt werden, die die tatsächlichen Auswirkungen auf meinen Internet-Zugangsdienst haben. So sollte ich zum Beispiel auch Informationen darüber erhalten, welche Einflüsse das auf VoIP Dienste hat, zum Beispiel Störgeräusche oder verzerrte Videoübertragung. Im Grund genommen will ich so genug Informationen erhalten, dass es mir möglich ist, vernünftige Aussagen zu meiner Quality-of-Service für meine Anwendungen (Video, Spiele etc) treffen zu können.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Davon halte ich gar nichts. Das ist ein Eingriff in meine Privatsphäre den ich nicht billige.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Mein Provider sollte keine Möglichkeit haben meine Daten auszubremsen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Knut Richter

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
NO DEMAND FOR SPECIALIZED SERVICES THAT I'M AWARE OF.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
ADVERSITY WOULD OPEN THE DOOR TO MORE ILLEGAL MONITORING BY LAW ENFORCEMENT

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
IF YOU'RE PAYING FOR YOUR INTERNET, YOUR ISP SHOULD HAVE NO RIGHT TO INTERFERE WITH YOUR TRAFFIC.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I'D LIKE TO MAKE SURE IT'S NOT BEING MONITORED OR THROTTLED.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, In a free country we should practice open(free) internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? Encryption!!!!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the people who wants too hide are already doing it so its only hurt the people who you serve.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Nothing

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Maximum speed, average expected speed (possibly a graph showing usage hour and procentage), if they treat content types differently and how, what information they relay tho a third party

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
John Ruhl

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

When ISPs offer zero-rating there will naturally appear to be a demand for it, but only because it creates an artificial distortion of incentives. This is absolutely not the way the Internet should work. A telephone company does not offer better rates or a better connection when you call their preferred pizza delivery company versus a non-preferred company, and everyone can see how wrong and corrupt it would be if they did. The Internet should be no different.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It makes it harder for new or small companies to compete, even if they would compete successfully based on their true merits.

Is there a demand for specialised services? Which services should be allowed this special treatment? If capacity is adequate, then giving better quality to some services is unnecessary. If it appears to be necessary, then the real problem is one of inadequate capacity.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the job of an ISP is simply to receive and send packets on my behalf, and the source, destination and content of that traffic is irrelevant.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Although it might seem reasonable to prioritize some traffic based on its type (e.g. latency-sensitive games or bandwidth-sensitive audio and video), it's mostly high-bandwidth applications that would need such preferential treatment, and in fact I believe that my simple small HTML pages should not be slowed down behind someone else's bandwidth-intensive video.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Information about all of these things is potentially valuable, but especially if unfair practices are being used. With real net neutrality, it's not so vital because you already know your traffic is being handled fairly.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

bla bla bla

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
niemals

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
alle

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann

nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Dr. Volker Schikowsky

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view? Internet should be completely free and also there should exist no throttling. Then zero-rating would be meaningless.

My name:  
Karsten Zarth

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

In my opinion there are no services that should be allowed to get extra speed on the internet, because that is equal to slow other services down.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)? Absolutely no! That would be a degeneration of democracy.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I only see negative impacts, it would mean, speed for the rich, and slowness for the poor. That's non-democratical.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Absolutely! Today almost every non-cripted internet communication is "proudly reviewed" by more and more secret services. Perhaps (in future or already yet) we should allow anyone to throttle maybe encrypted internet traffic. At least I fear that could happen.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No! That's only my business. Nobody should track that, although many do. But nobody should get an extra permission to do that.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

My ISP should have no rights for that. That destructs democracy.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, it would.

What would you consider to be "reasonable" traffic management measures?

How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

No traffic management measure could ever be "reasonable". That's a slowly ticking time bomb, at last only the rich (companies) would have speed on the internet, and the poor won't survive, that's non-social.

That's a slowly destruction of democracy.

What information would you need to make an informed decision about your Internet connection? For example: traffic management; commercial practices or technical conditions?

The more information, the better. At least: traffic management; commercial practices and technical conditions.

What information would you like to receive about the speed of your Internet connection?

My ISP should guarantee the least internet speed.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes they should. You should be able to throttle payment if these parameters are not reasonable fulfilled.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
No specialized services

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
speed is important

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
James McConnell

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Nope

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All of them.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.
