Call it by any name -- restricting access for PROFIT affects ALL end-users adversely. Let those with a profit motive have the IDENTICAL "service" all the rest of us have. If they have a good product, they will find success in the marketplace without disenfranchising anyone else who uses the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

ALL innovation could be "reserved" for those with deep pockets. Small innovators could/would be squeezed out of the marketplace in favor of industry giants who could determine, from their own profit motive, whether or not a particularly beneficial (from a public interest perspective) innovation would EVER become available.

Is there a demand for specialised services? Which services should be allowed this special treatment? I am unaware of any "demand" that warrants "special treatment" outside of the kinds of things that now are allowed to disrupt ordinary TV, radio, and telephone services -- announcements of terror attacks, assassinations, impending tsunami, landfall of hurricanes, spotting of tornadoes, earthquakes, floods, etc.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Personal privacy MATTERS. We should NOT give it up easily. Private entities "advertising" opportunity (i.e., profit maximization) interests should NOT dictate public policy regarding either the internet, snail mail, or printed media. Private entities did NOT create the internet. They didn't create the rights to free speech, free association, etc. Don't give a micrometer to allow "rationing" of access to low income, marginalized, or other disadvantaged users of the internet. It is like the air that we breathe -- let the privileged breathe the same air, not some specialized version of what everyone else gets. Then the incentive will be to improve the "air" that everyone breathes.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

If throttling or prioritization is allowed, it should ONLY be for the benefit of PUBLIC entities -- like taking over TV station and Radio broadcasts to make public announcements in emergencies and restricting private phone use in like situations. If it is allowed for other reasons, the ISPs will use their own PROFIT motive to disenfranchise the masses in favor of the privileged.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Cheryl Keith

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREK Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Streaming und VOIP verdienen in meinen Augen eine höhere Priorisierung als andere Dienste, die nicht Echtzeit kritisch sind wie z.B. EMail.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Sollte mein Provider eine monatliche Beschränkung der Datenmenge einführen und eigene Dienste davon ausnehmen, werde ich ihn sofort wechseln. Ich nutze Netflix, Amazon und Maxdome. Die Nutzung wäre gegenüber z.B. Telekom Entertain nur sehr eingeschränkt möglich.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Streaming kann beschleunigt werden, VOIP darf ebenso bevorzugt werden.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte informiert werden über eine etwaige Einschränkung bestimmter Dienste, die maximale Geschwindigkeit, Reaktionszeiten bei Ausfällen und die durchschnittliche Anzahl der Ausfälle pro Jahr.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Auf gar keinen Fall. Es geht keine Firma etwas an, was ich herunter- oder hochlade.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Thomas Friedrich

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Laily Nator

I know of nobody who desires specialised services, the current internet connection model is fine as it is. I have had no issues with connectivity, so I see no need for change.

If specialized services were implemented, more powerful monopolies will have the power to strangle start ups or telcoms and censor information

when I subscribe to a flatrate I want to be able to have monthly unlimited access to everything at an equally fast speed, as promised in commercials etc.

limiting data and zero rating makes me be more mindful of which websites I open, because an image or an ad can make me cross the limit.

Traffic monitoring is one of the biggest violations to privacy and communication rights imaginable! I'd boycott anyone who tries to pull it through! What ever happened to secrecy of correspondence?

ISPs shouldnt be able to tamper with internet speed at will, I want the speed the cable can provide, I dont want to have to pay more for a service I already pay for. Why is it so obviously greed-driven?

its fine the way it is, thank you

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in

increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

there's no demand I can think of from consumers only from companies that want to turn the internet into a TV station where they control the content and you pay for it.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can't think of any benefit to come from this, internet toll booths and fast and slow lanes are a form of digital apartheid.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
none at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

hell no!, certainly not, they can measure my traffic patterns but my communications and info sent are all confidential

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none at all, all interference no matter how slight is still censorship.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of it, I want to know why these providers cannot provide a consistent service to me.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Mark Bridgeman

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

George

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

There is no demand for specialised services. Already today there is build in qos( queque of services for traffic management ) that provides traffic flow without congestion

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

It could mean that paid services are fast and the free services are slow.

The internet provider is controlling the internet.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

It is negative fir the end user and kill competition for the big companies. You pay for services and the free internet is strictly regulated and no openness

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No, ISP should not be allowed to monitor your traffic. This will result in surveillance, censorship and control the internet.

The ISP is already doing traffic management with the purpose to hinder congestion and free flow of the traffic.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

They should not be able to interfere with your internet connection. This will only lead to controlling the connection and controlling the internet. It will undermine the net neutrality

Quality and speed should remain consistent regardless of the type of content being accessed

If companies interfere and restrict or limit access to specific points on the Internet, this will have an obvious impact on our freedom of choice and access to information.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

ISPs should provide information on quality of services parameters in very clear language in all contracts.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
NO. People already have the ability to select speedier packages. We don't need "specialised services" that allow companies to prioritize what THEY want to. This is not beneficial to users. Users are not asking for this, big telecom companies are asking for it so they can extract more money from us and limit users. We want an OPEN and FREE internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Regulation of "specialised services" will allow for a discriminatory fast lane and would infringe on our freedom of communication, competition, and innovation. We don't want corporations controlling the internet and they have no right to do so. Please protect a free and open internet!!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. And ISPs should provide information on quality of services parameters in very clear language in all contracts. I should have the information I need in order to make reasonable assumptions about the quality of the service available for my particular priorities (gaming, video, etc).

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

End users should be able to choose priority of online traffic.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den

Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
jj

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No services should be allowed special treatment.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for commercial practices like zero-rating among consumers but I'm sure providers would love it.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Absolutely.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Michelle Mitchell

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is wrong. With media companies controlling all other sources of information, net neutrality is our only escape from oligarchy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference with my internet connection.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht! Ich will weiterhin selbst entscheiden welche Dienste ich bevorzuge oder drossle!

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er

den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Manfred De Pari

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich kann keinen legitimen Bedarf für kommerzielle Praktiken sehen. Mein Video-Streaming oder video-on-demand muss ablaufen können, ohne dass ich bevorzugt werde.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

negative Einflüsse: Das Internet degeneriert in ein TV-ähnliches Unterhaltungsmedium, dessen Offenheit und Innovationsfähigkeit von wahrscheinlich wenigen (oligopolistischen) Content-Anbietern festgelegt wird. Die heutigen Möglichkeiten des freien Internets werden nur noch von einer Untergruppe der Internet-Nutzer wahrgenommen. Damit werden letztendlich die z.Zt. angebotenen demokratischen Informations- und Mitwirkungsmöglichkeiten beschränkt.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Ich wüsste keine Spezialdienste zu nennen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Internet Service Provider soll meinen Anschluss nicht beeinflussen können

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Angabe meiner durchschnittlichen und aktuellen Übertragungsrates mit gleichzeitiger Angabe der höchsten und niedrigsten Rate (Maximum .... aktuell ... Durchschnitt ... Minimum). Technische Begründung für den aktuellen Zustand des Traffic-Managements, d.h. für die gegenwärtige Bandbreite

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese

treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

---

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
The only services which should be prioritized are ones offered by the government like e.g. the police

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No what I do is my business

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
They shouldn't interfere. If I want a prioritized Service I can tell my router to do it myself

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I would like to get all information about how my data is handled and why it's too slow sometimes

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Lukas Watzl

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

None. Keep it open an standard

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

User speed degrade and lack of same fast speed for all

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Min tracking. No deep packet

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Min to none

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

None.my isp charges me enough for the 10 meg with 50gig cap an still not adding 4g service near me.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Stitz

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Negative Einflüsse könnten Internet verlangsamen bzw zu 2. Klassen von Kunden führen

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Ja z. Bsp. auf Berufsgruppen bezogen

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Alles

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only "demand" comes from the big media controllers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Hell NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Daniel Miller

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
yes it could there is no need for it

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
little to never

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Kent Cole

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
kein bedarf, Endverbraucherrechte dürfen nicht beschränkt werden

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich will ein offenes Internet, um die Freiheit der Kommunikation, des Wettbewerbs und der Innovation zu erhalten.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Ich will keine diskriminatorische Fast-Lane.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich will klare und verständliche Aussagen über die Parameter der Quality-of-Service.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und

nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Enrico Walter

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Judy Wyeth

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any intentional limitation of communication speed that is available would deny the advancement of technology. Remember when the church tightly controlled the printed word, I believe they called it the the dark ages. You know the world is flat!

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. That is the ultimate question.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Complete denial of information exchange. Imagine how open and honest government would be if they had the opportunity to create more specialized services.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

We know how our traffic is managed. At the lowest possible level because you should be thankful for what you get, improvement is only achieved when governments are pressured.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Anyone throttling or prioritising Should be jailed. It should be considered the same as jamming cell phones.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO they should not unless there is a reasonable cause to suspect wrongdoing and only with court approval. Many of the security services and law enforcement agencies are employing better filters to reduce the volume of data. Sifting thru data without a clear purpose is a lesson in futility that eats bandwidth slowing overall communications.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not, especially without due cause. This is a violation of a person's privacy rights. It is undemocratic in its limitations on a person's freedoms!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating is the thin end of the wedge, not necessary, and looks like a free gift but requires loss of net freedom

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It will mean the companies with the most money will narrow the internet into a means of delivering their products and their agenda. Not an open platform for the user to find information from a broad number of competitors.

Is there a demand for specialised services? Which services should be allowed this special treatment? Cant think of any

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Isp should not be allowed to monitor traffic content for the purpose of traffic management

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Isp should not be allowed to throttle different types of traffic

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Contention rates, variation in peak and trough speeds, how traffic is monitored managed and logged.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISPs should not be able to interfere at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All information regarding my connection.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Judith Mühlenhoff

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No. There is no demand. I have no examples.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I'm repeating my self here. When I have paid and bought the speed and volume it's mine to do with as I please.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Also how the speed and volume is measured.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. The whole idea that governments have got about surveillance is perverse!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They shouldn't at all. As long as I pay my bills, I should get exactly the speed and volume I payed for, and it's mine to do with as I please.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Emil Kampp

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. We either cherish liberty and privacy or we will be inviting tyranny. Note to the ruling class: it is best not to rile hundreds of millions of people.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I ask for no specialized services. No service should be allowed special treatment.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services that relate to accessibility to the internet prevent new online services from forming and bringing new and possible better services than other online services. It will limit competition to those that have money only.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't demand for anything other than the ability to use the internet to any site or service equally. Controlling the flow of traffic to any site removes the ability for me to decide where I can go online. Any site has the right to get traffic just as much as any other site.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP should NEVER be able to change the speed of any content being sent or received through a service. They must be accountable to always provide what speeds we are paying for (plus or minus a small percentage) and provide a way to determine why a service is slow and fix it if it is their network problem.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, not only do we need the ability to freely communicate we should be able to communicate anything.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Everything, if my service is not what I am paying for then I want it fixed. The ISP (along with the online service) should be able to tell me if the source service is not able to keep up to explain why I am not getting good through-put. Or vice versa, why my internet connection is not able to keep up.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

I am very concerned that certain “commercial practices” such as zero-rating and Fast-lanes could ultimately limit my rights as an end-user of the internet. I believe that such practices create an unequal playing field -- contrary to what we hope and expect the internet to be.

Fast-lanes, and zero-rating will surely influence how people use the internet, causing access to certain sites to become restrictively expensive.

Furthermore, I don't believe that the ISP should be allowed to monitor my internet traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management, OR to interfere with my Internet connection - for example by throttling or prioritising certain types of online traffic (video, P2P, etc).

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There will always be a demand for something that is free. If ISPs want to offer some sort of free service, they can always offer a certain amount of bulk traffic up and down to anywhere on the internet, for free. Zero-rating is portrayed as free access to certain sites that want to drive up their traffic/increase their userbase, which is the whole point of the commercial takeover of the internet - get people to go to a handful of centralised sites and control them.

I don't use sites where this would apply (such as Facebook), so I'm not impacted directly, but it is the usual slippery slope concept where you start off with a hands-off unrestricted unregulated internet access, and this previously-realised ideal is violated more and more over time, in this case getting ISPs comfortable with the idea that certain traffic is more important/special/different than others, and therefore treating it differently.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Sorry, I have no idea about 'positive impacts' that 'specialised services' could bring about, I'm only aware of the negative aspect that is covered by my answer to the previous question.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Sorry, I'm not really aware of specialised services. If they can come up with communication that is so critical, then this should be dealt with over a separate lower-capacity line covered by a better Service Level Agreement (since it sounds like 'specialised services' communications are not fit for best effort handling, and should therefore be serviced by a strong guarantee).

This however still ends up with bandwidth discrimination on the ISP network, particularly if they oversell their connections and can no longer serve the traffic people are paying them to transit - the high priority traffic will cause the normal traffic to be degraded, which is unacceptable.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No - I pay for my internet services with the expectation that my packets are not logged, analysed or have any other such activity applied to them - I expect them to be treated as a black box (not everything can be end to end encrypted yet), beyond inspection of headers etc that is required to route the packets.

Essentially, I'm paying for unadulterated packet sending and receiving, according to the technical limits of the line and 'package' I pay for (i.e. I can't expect an upload speed of 2MB/Sec (megabytes per second) if I only pay for 1MB/Sec, but I do expect all packets to be served on a first come first served basis with equal priority regardless of their content).

'Traffic management' violates this, so is not something I can support.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Any interference of packets must be opt-in (e.g. through options set on the ISP's website for the user), such that they are controlled by the user. The user does not exist to pay or abide by the ISP, the ISP exists to serve the user, so anything forced in a top-down fashion to the user is unacceptable (e.g. through the terms of contract etc).

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Maximum upload and download speed allowed by the internet service purchased.

Actual line speed synched to at the exchange.

A network diagram of utilisation of the ISP's (and their ISP's etc) network Any and all situations where the traffic is slowed down or dropped relative to the speed that it is being requested/served it.

Some large ISP network utilisation diagrams are available, however most normal ISPs will not publicise this, since if they tell the truth it will likely show significant congestion on their networks (i.e. the result of overselling bandwidth and highly contended exchanges etc), but at least that will allow people to understand where and why their traffic is being slowed down/dropped. Different ISPs can then compete by demonstrating ample capacity, however many will use BT's network, whose capacity they can't control (but again it will demonstrate the problem).

Keep in mind that dumbing down information to the level where everyone can understand is not a solution for everyone. Simplified/trivialised information and stats must always be presented alongside the full truthful information for those that can cope with it (this at least gives knowledgeable people the ability to detect bullshit being foisted in some executive summary etc).

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Philip Haworth (UK)

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Natalie Blasco

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Christoph Storm

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

'specialized services' might be ones which require some sort of real time treatment, e.g., VoIP, Video streaming or Games.

But coming up with the required QoS enabled behaviour should be done by the IETF or similar organizations for worldwide compatibility! Not by individual ISPs, based on a profit and market based strategy which aims at hindering other services.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Positive: Specialized services having higher priority and faster connections.

Negative: Incentive for ISPs to declare more services as special, demanding additional fees for customers (on both ends) for no real additional effort. Effectively this will hinder further investment in faster Internet (fiber-landlines, etc.).

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

I don't see a demand for zero-rating. Instead I only see drawbacks when I'm virtually punished for choosing one service over another, just because of ISP policy.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No. All Necessary information is/must be part of the traffic headers, no further information is required by the ISP for forwarding or routing operations.

As I see it, deep packet inspection directly violates §8 of the European Convention on Human Rights and the European Data Protection Directive (Directive 95/46/EC)

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

Prioritization of specific streams, as specified by eventually deployed packet headers, is ok.

I don't concur with every other form of purposeful traffic manipulation.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

Generally: Everything.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, my traffic should be private. By inspecting my traffic is breaching my privacy and other methods should be used to monitor traffic

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be able to prioritise my traffic - advertised speed should be equal for everything.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Make valuable information hidden from public.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

there is no demand from the customer and it is certain that these so-called 'commercial practices' limit and distort my end-user rights to ends that are not my own.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

suggestion WITHOUT coercion might well serve both customer and commerce... the subtle coercive techniques lead to manipulation of information and all manner of underhand skulduggery.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
no

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

in no way

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

i do not consider ANY interference acceptable

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

i should like full - and simply stated - openness on all the above.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Meiner Meinung nach gibt es keinen Bedarf für "kommerzielle Praktiken". Zero-Rating könnte aber für staatliche- oder Notfallinformationsdienste verwendet werden.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Einflüsse von Spezialdiensten könnten für die Zukunft des Internet eine Monopolisierung von Spezialdiensten und die Zerstörung des freien Dienstleistungsmarkts im Internet.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

staatliche Dienste, Notfallinformationsdienste

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, die Anzahl/Größe der Pakete wäre für mich okay.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Maximal +/- 10% der Geschwindigkeit, die im Vertrag (o. a.) steht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Geschwindigkeit, IPv6 Unterstützung, Adresserneuerungszeit, Verfügbarkeit von Port-Umleitung/Öffnen von Ports, Traffic-Management.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
David K.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Simon Praetorius

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't think that there is demand from the customer's side. Currently there are no actual bottlenecks in data transfer if everyone agrees to reasonable peering rules between providers. Specialized services would only help providers and provide no benefit to the end user.

The positive impact is that telecom companies will have another source of income and could invest even more in their networks. On the other hand specialized services will create a significant barrier for new companies entering online markets because existing companies with more money can afford to pay for special treatment by the telecom companies. Startups on the other hand have always profited from the openness and equal treatment on the Internet. This is why specialized services will stabilize monopolys or oligopolys in the market.

I'm sure that there is demand for "commercial practices", but not from the point of view of the end user. Sure, it might be that you can listen to one music streaming service without "paying" for it on your data plan, but it also means that your provider influences your decision on a music streaming service. If you want to use another service that fits your needs better than the service with a "special deal", you have a clear disadvantage.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir or Madam,

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Casual end-users might appreciate having some free services, but it allows larger content providers to pay money to get more usage while start-ups unable to afford such ratings cannot compete with a larger established provider.

Is there a demand for specialised services? Which services should be allowed this special treatment? I could perhaps see a limited communication utilized by emergency services and other critical government agencies. The private sector should not be allowed to restrict freedom. It has the same issues as the zero rating concept.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, it makes it far too easy for them to start charging differently based on different content, or block content they choose not to like for whatever reason.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It should not be able to discriminate based on data type.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Nicholas Hollander / WyvernIRC

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no, not without a court order at least.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
only the absolute minimum to keep things running.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Telephone and similar emergency communications which are low bandwidth in nature.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

All users should have access to an open and unlimited internet. If they choose to limit their access to only part of the open internet then that is their choice as long as they also have the option to regain full internet at a basic cost. A restricted internet should be an extra cost option on top of basic open internet access. Don't make people pay extra to gain access to the full internet.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

All uses should be equal. Users often don't have a choice of ISP so they don't have any easy way to avoid such actions so at this time they should not be allowed in order to maintain an open, equal internet for all users.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP should not be able to control data by 'type'. I have mixed feelings about controlling large quantities of data as that negatively affects the web for everyone and is often used as a form of attack.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. ISPs should only be infrastructure providers, not internet traffic moderators. Data should be free to move without examination, restriction, or modification.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

minimum speed guaranteed, data caps are bad but if present there should be a way to accurately measure data consumed and also measured from the customer end for comparison.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would enable me to work from home. With these connection it is not possible.

Is there a demand for specialised services? Which services should be allowed this special treatment? We really would appreciate it, if would have a better performance then now. Not only in cities are living people who want to work via Internet, also in the smaller cities in Germany.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, this is private. Even if I have nothing to hide... It makes me feeling like someone is watching me while I'm sitting in a house made out of glass

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

We would be very happy if our ISP would perform for what we are paying... Video would be ok, but this seems to be s.th. for the next generation

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

speed, quality of service, and this please without the usual break-down and interruptions

The Regulation allows specialised services only under strict safeguards. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If Netflix doesn't count against my data, but Amazon or another new service does, that is an unfair advantage. Zero rating is NOT neutral. It still amounts to favored fast lanes or preferred treatment for some and not others.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

New services, by definition, will not have the advantages of entrenched specialized services. This makes entry into the market place for new technologies and services that much more expensive. It's like giving preferred treatment to buggy whip or sealing wax makers. The market should be able to decide based on a services merits.

Is there a demand for specialised services? Which services should be allowed this special treatment? The demand is from the vendors or from people who think that they are getting something for free. No one should be special.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Traffic content should be treated equally/ neutrally and is not the business of the ISP.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference at all. I pay for my connection and if I am not violating my terms of service or the law, they have no right or reason to interfere. ISPs provide a service. They are not Internet cops. Provide the pipe and get out of the way.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it should be available on demand. If there is to be real competition, this information should be freely available.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

A special source of media might be free so that especially poor people get their information only from that source. Now there are lots of free sources of information to choose from if you can pay for data transmission or get it free without discrimination.

Also, newcomers with little capital could not afford to provide zero-rating like big corporations. Entering the market would be harder, monopolies promoted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

negative:

no investment into infrastructure: you need standard services to be bad so you can charge a good price for special services, more power and market share for corporations, worse chances for innovative newcomers discrimination to quality media that does not belong to a corporation more surveillance against political/ environmental/ human rights/ free press activists, getting molested by bullshitstories that I needed special services for google-cars and operations

pros:

none

Is there a demand for specialised services? Which services should be allowed this special treatment? Did I miss a specialised service? No. I will not in the future, either.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. If they watch my content, everybody can do it and will do it: CIA, FBI, German secret services and governments.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all - this is what net neutrality means. We do have the technical means to provide fast internet for all services, people and places.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Which third parties did receive data about me?

Has there been discrimination of data? Who exactly did profit or pay?

What was the average speed?

What and when did I have the lowest speed?

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

What if I create a protest sight and the content doesn't sit well with some at my ISP, could they use zero rating to make that site inaccessible. This creates potential censorship. I am sure many ISP's in parts of the world would love to use such methods to block Wikileaks and other sites

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Quality of service will always be a part of making the internet better, it does have potential downsides allowing an ISP to reduce traffic to any site or group of sites unbearably slow in the method used to manage the traffic. Balance not destruction of a class of traffic is needed.

Is there a demand for specialised services? Which services should be allowed this special treatment? Yes for health and safety. In the times of an Emergency their is public benefit in allowing people to be able to access some services to improve health and safety

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Yes but only to improve the experience of its customers, it can provide the ability of ISP's to stop viruses and other malware entering their networks and afflicting their customers and potentially themselves. For this I would accept deep packet inspection as it provides a consumer benefit. If it is used to negate net neutrality then it would need to be stopped

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

We would not have the innovation we have now on the internet if companies could throttle Google might not exist, Amazon might not exist and why should I have a bad experience with any website because a competitor bought the ability to speed their traffic over the smaller competitor. This should defy all anti competition laws along with the consumer rights in any reasonable country. How it could be considered at all with that in mind boggles the mind

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Severe penalties, percentage of turnover part of which would be used to fund Net neutrality messages should be inflicted in those found to. Accurate traffic maps should be readily available they are easy to publish from network management systems. Shaping alerts could be displayed if due to a current global event there is a traffic surge that requires the ISP to shape and show the daily, monthly, and annual average and median user connection performance would all be great pieces to add to the mix of transparency

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every

enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Peter Mclarty

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Keep my rights and privacy

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No demand

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Only if it was made to sound beneficial

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
it would Curtail the free and open internet

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No in not ever

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Should not be able to interfere

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
None personally as I can find these things for myself

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating encourages people to use some services which are wealthy enough to be able to pay the ISPs for zero-rating status, favoring them over smaller more independent services and websites (ex: encouraging use of Youtube over say Vidzi for videos because Youtube might not count your monthly download limit whereas Vidzi does). It only benefits the ISPs and the very wealthy companies who can pay them and is anti-competitive. It should not be allowed.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I don't know enough about this aspect of this issue to comment.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't know enough about this aspect of this issue to comment.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like all collectible information about it to be available to me, even though I personally will use none of it. Some people definitely will use it.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Of course not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. ---

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-Rating bevorzugt die Dienste großer Unternehmen. Ich als Endverbraucher werde denjenigen Dienst bevorzugen müssen, der mir geringere Kosten verursacht. Kleine und mittlere Unternehmen haben mit Zero-Rating eine höhere Markteintrittschwelle, da mir als Verbraucher die Nutzung der angebotenen Dienste durch eine zusätzliche Hürde - die im Vergleich zum bevorzugten Dienstanbieter höheren Kosten - erschwert wird. So wird es innovativen, aber kleinen Unternehmen unmöglich gemacht, ihren Dienst am Markt zu platzieren. Zero-Rating verhindert damit den notwendigen Wettbewerb in Europa.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste können schnell zu Überholspuren werden, die sich nur die großen Marktteilnehmer leisten können. Kleinen und mittleren Unternehmen wird der Wettbewerb erschwert, da ihre angebotenen Dienste zweitrangig behandelt werden. Als Endverbraucher der angebotenen Dienste werde ich mich über kurz oder lang für den Dienst entscheiden (müssen), der von meinem Internet-Provider bevorzugt zur Verfügung gestellt wird. Als Verbraucher habe ich allerdings keinen Einfluss darauf, welchen Dienst mein Provider bevorzugt unterstützt, obwohl ich vielleicht gerne den innovativeren Dienst in Anspruch nehmen würde. Spezialdienste behindern und verhindern somit Wettbewerb und Innovation.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Heute selbstverständliche Internet-Dienstleistungen wie Videokonferenzen oder Online-Spiele dürfen nicht zu Spezialdiensten erklärt werden. Aus meiner Sicht sollen nur Internet-Dienstleistungen als Spezialdienste eingestuft werden, die die Daseinsvorsorge berühren. Das wären für mich Anwendungen im Bereich der Verkehrssteuerung (Ampelsteuerungen, Steuerung des öffentlichen Nahverkehrs), der Energieversorgung (Kraftwerkssteuerung) und Dienste im Zusammenhang mit Katastrophenschutz und Frühwarnsystemen (z.B. Kommunikation von Behörden, Polizei und Feuerwehren).

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Eine Überwachung meines Datenverkehrs durch den Internet-Provider mit dem Ziel, den Datenverkehr besser managen zu können, ist ein unverhältnismäßiger Eingriff in meine Privatsphäre. Die Post öffnet auch keine Briefe, um entscheiden zu können, welchen sie davon schneller als andere zum Empfänger transportieren sollte.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Mein Internet-Provider stellt mir meinen Anschluss zur Verfügung. Er ist darüber hinaus aber nicht in der Lage, zu entscheiden, welche Dienste für mich gedrosselt oder bevorzugt von Vorteil wären. Eine solche Entscheidung kann nur ich als Nutzer dieser Dienste treffen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Als Verbraucher und zahlender Endkunde benötige ich diejenigen Informationen über meinen Anschluss, die mir eine Beurteilung darüber ermöglichen, ob mein Provider die vertraglich zugesagten Leistungen auch tatsächlich liefert. Aus meiner Sicht wären dies die durchschnittliche Übertragungsrate meines Anschlusses, die Verfügbarkeit und - falls tatsächlich vorgenommen - die Bevorzugung und Drosselung einzelner Dienste und Anbieter. Liefert mir mein Provider auch Telefon- und TV-Dienstleistungen, so ist die durchschnittliche Qualität im Vergleich zum vertraglich vereinbarten Quality-of-Service auszuweisen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Patric Schirrmann

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Again, all bits cost the same to transport.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Content providers that can't afford prioritization will be squeezed out. This will tend to be new, innovative sites.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None. Bits are bits

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, and not for advertising either

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. I pay for bandwidth, and all different types of bits cost the same to transport.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and QoS should be part of the contract when I purchase service. It should be based on bits per second without regard to the type of bits.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Edward Mills / individual

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

My name:  
Carl Parish

Is there a demand for specialised services? Which services should be allowed this special treatment? Emergency services (police, fire and ambulance emergency information/contact, with the consideration of coast guard and air ambulances, not VoIP, no commercial content streaming of any kind)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Pros - Faster streaming and downloads from specific websites, better quality VoIP calls, faster Windows updates

(Massive) Cons - Slower browsing, streaming and downloads from majority of websites. Startups, small businesses, non-profits (basically any entity that isn't a large enterprise) would be unfairly disadvantaged as access to their services could be throttled to allow a competitor better quality of service.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No. This would provide large enterprises to have a huge and unfair advantage against almost any other entity who wouldn't be able to afford this. The only place this leads is low data caps for customers (meaning you would be limited to how many non zero-rated services you could use in a month). As data caps have been raised over the last ten years to allow many services to be viable (Netflix, Amazon Prime), it would be a huge step back to allow them to be lowered for everything but the largest of these services, also giving these services a huge competitive advantage over smaller, newer or cheaper options.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This communication is private unless otherwise stated. The idea that someone's private communication can be monitored solely for the purposes of traffic management is a huge overstep. There is no metric to measure how important any piece of traffic, so the idea that an ISP would be making this decision arbitrarily is worrying, especially as there will be some traffic they are unable to analyse (as it is encrypted).

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

You pay your ISP for an internet connection. Your premium for this is based on the connection speed you are meant to receive. What you use this for it entirely up to you, not the ISP. If the ISP doesn't have capacity to fulfill the contract they have with their customers then this is an issue with the ISP,

and the customer's traffic, irrelevant or content, shouldn't be effected, let alone throttled.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

There are few reasons not to be completely transparent about the service any business provides their customers, and traffic management/manipulation isn't one. If an ISP is worried they're practices will cause issue with their customers if it were to become public, then they should change their business practices.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No interference.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

They absolutely interfere with my rights of choice, a zero-rating scheme would deflect my path towards their preferred vendor (i.e. those that provide them the most profit,) and deflect me away from looking for the new, innovative boutique vendors that I would prefer to shop with.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No it should not, ISPs should be utilities that provide access and have not interest in the content that traverses the lines. The internet should be thought of as just a new segment of the transportation system, as a means that allows us to interact as buyers and sellers, and we should not allow ISPs to interfere and control how the traffic flows, purely to multiply its ability to extract profit from the system.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Anthony Doherty

---

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Ich sehe keinen Bedarf und befürchte eine "Verlangsamung" meines privaten Internet-Verkehrs.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
garnicht

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Peter Zündorf

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No, confidentiality should be respected.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
They should not interfere with my internet connection .

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Maybe QoS for more latency-sensitive media, but that's it.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? sure there is a demand on specialised services, but it should not be allowed.

Expection emergency services like Fire brigade, Police, and medical Rescue.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Dieter Bischofberger

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, only in case of actual congestion, with complete content agnosticism

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Jean Glassman

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There certainly is no such demand on the part of content users. Service providers are the only ones who would profit from variable rating schemes.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Startups and small operations would not be able to grow and expand their user base if they had to pay extra for their end-users to access their services.

Is there a demand for specialised services? Which services should be allowed this special treatment? Not on the part of end-users. This is all about profit for service providers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. What I access online is my business. It's a violation of privacy to monitor what I do online.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Most of the podcasts I access are associated with public, member-supported radio. Obviously such outlets would not be able to afford the fees to purchase high-speed services. Since they would be less profitable in an environment in which content providers have to pay extra for smooth streaming, what I can listen to now without interruption would be caching every few minutes. Neither content providers or users should have to pay extra for smooth streaming.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know the actual speed of my connection, since my provider is always advertising its superior services and I can detect no difference after alleged upgrades.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Judith Blair

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Qos for video

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Real Throttling on services.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
undefined

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Sonja Waldgruber

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No services should receive special treatment. The access providers should not be allowed to handle traffic different based on service type.

Current specialized services could prevent future innovation. If the access providers differentiate based on the service they must inspect the traffic to identify the services, this could lead to another surveillance method and clearly identify encrypted traffic.

If zero-rating grows, this could lead to higher prices for neutral access and discriminate people with less money. This would widen the digital divide! If zero-rating services become the new standard, how would one argue to have rights for an affordable full access.

No, the ISP should never monitor the content and type of my traffic. The obtained data would immediately get used for further surveillance. And who decides what traffic is valuable and should have priority?

The ISP should offer a full neutral internet access and not interfere with my internet connection. I pay for the access and decide what services I use. The ISP should not decide which of the services I use are more important than others.

I would like to receive information of the actual speed and the availability. Each disturbance of the service, as the 8h reconnect, should be collected and if the down time reaches a certain value, there must be an automatic refund.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. habe ich mich noch nicht mit beschäftigt

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste koennen die Innovation foerdern, gehen aber meist zu Lasten der Offenheit. Auch koennen sie die allgemeine Innovation behindern, wenn zu viele Spezialdienste vorhanden sind. Man muss das fuer jeden Spezialdienst gesondert pruefen und bei Gefaehrung der Offenheit oder Innovation die Einfuehrung evtl. verhindern.

o.k. die Zusatzinformationensagen schon einiges.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

medizinische Dienste, Rettungsdienste, Katastrophendienste und Teile der Sicherheitsdienste

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Ich bin gegen jede Ueberwachung meines Datenverkehrs

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Grunsaetzlich garnicht, allerdings koennte ich mir fuer Video-Streaming bzw. grosse Entertainment-Daten eine Drosselung vorstellen. Keinesfalls sollte er Grosse Datenmengen (Video, Fernsehen, Unterhaltung u.Ae.) bevorzugen (es sei denn, ich wuensche dies fuer meinen Anschluss). Das Internet selbst sollte alle gleich behandeln.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Grunsaetzlich ALLE Informationen (so kann ich entscheiden, ob ich Behinderungen des Internets vermeiden kann bzw. ob ich selbst wodurch behindert werde).

mit freundlichen Grüßen,  
Hans R. Burghardt

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My company is Chris Marquardt Media.

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

I don't think any internet services should be allowed special treatment.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Giving specialized services preference will make startups and small companies less competitive.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

ISPs should only be allowed to do this in very narrow and specific cases that need to be very clearly and transparently defined.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

My ISP should not be allowed to do this at all. If there is a technical need to interfere with my internet connection, I want to know what is being done and why.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I would like to receive all information regarding my internet connection, especially the guaranteed speed, and how my traffic is managed.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I believe there is no market demand for "commercial practices" such as zero-rating. It is there solely to benefit ISPs and corporations not internet users.

Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. For example, this system would influence me to view websites that has zero rating where data download is not counted against the monthly data quota. Perhaps there is a higher quality website out there but I avoid visiting it because viewing the website will reduce my monthly data download quota.

It sounds like you get something for free, but it makes your mobile operator become a gatekeeper and gives it a reason for lower monthly data caps.

Any commercial practices which limit user’s rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positives: more expert knowledge

Negatives: specialised services are usually costly e.g specialist doctors, specialist lawyers. Specialised Services risk becoming the paid fast-lane for big Internet companies that push every other website, idea and start-up into the slowlane.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't think there is a demand for specialised services from everyday user like myself.

In my opinion the military, intelligence agencies, government, banks and other large corporations already enjoy this special treatment. I guess they need it to stay on top of the food chain.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Nooo

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interfering with customers' internet connection. ISPs must provide equally fast internet to every user.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Mr Marco Setiawan

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Obviously big commercial enterprises such film studios or recording companies would prefer to have their content prioritised on the Internet and can afford to pay for it but that is against the democratic nature of the Internet, particularly considering the fact that the entire infrastructure of the Internet was developed by the state through public funds.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The impact of specialised services on future innovation and openness of the Internet would be negative because other mass media, it will be discriminated in favour of the wealthy and the powerful rather than anyone with a good idea.

Is there a demand for specialised services? Which services should be allowed this special treatment? There probably is a demand for specialised services for those with more resources who would like to get prioritised access.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know the speed, the quality of service and whether anyone else's connection is prioritised over mine.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Pirooz Daneshmandi

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
VoIP bevorzugen, das war's

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er

den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,

s

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Sie können meine Rechte als Endverbraucher einschränken, wenn ich gezwungen bin Youtube zu nutzen, da dies mein Datenvolumen nicht beeinflusst.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Negative Einflüsse sind weniger Innovation, das Zurückhalten von neuen Firmen und Ideen, das Bevorzugen von großen Corporations. Positive keine

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein, gibt es nicht. Es gibt Bedarf an ausgebauter Netzinfrastruktur

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, auf keinen Fall

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Er sollte dazu nicht in der Lage sein

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Traffic-Management

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Nikolai Hartmayer

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

No. We should simply advance the infrastructure.

My name/organisation:

Vroni Retzer

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Functions which are absolutely rrequire stable connections must ensure these connectens elsewhere, but not via the internet.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

I don't think so. And there is no need to open up possibilites which are unnecessary.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Likely normal traffic will be on the slow track and everyone who cannot afford to pay extra such as civil (NGO) organizaitions or start ups or simply citizens will be pushed aside. Thus the internet degrades to a business net for large multinational corporation. This is unfair as these have more power already.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

No. Commercial practices should not be those who limit others. For the functioning of our society civil organizations (see above) are much more important.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No! No! No!!!

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not at all. This is private content and should be protected by the privacy of correspondence. Nobody should interfere with it.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Depends on who defines which content is how time sensitive and how this is regukated and controlled. As this seems rather complicated, I'd say:

yes.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Wealthier and/or larger companies will end up controlling both content and access. This would be the OPPOSITE of "neutrality"

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The "average" or "common" man would be forced into 3rd class citizenship on the net

Is there a demand for specialised services? Which services should be allowed this special treatment? Above all 911 services, and if ever secure enough voting.

But certainly ONLY services that provide for the universal public good

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

FASTER universal service - why is the country that invented and created the internet so low on the list of countries with fast universal service and yes, I'm talking about taking a back seat to South Korea ! ! !

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The purpose of the internet is communication it is NOT Spying

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

This is Electronic PREJUDICE, nothing less

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Reuel Sherwood

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

In a word, no. There are adblocks and antiviruses. There is no need for a "zero rating" system.

Is there a demand for specialised services? Which services should be allowed this special treatment? No services should be receiving special treatment because they are affiliated with big business. I couldn't care less about how much money you're making as long as you entertain me. If you honestly think that the internet should be more like cable television, you have the right to your opinion. But consider this, wouldn't it be cool if you could watch good stuff for free, and to create things without restriction imposed by a legal team, or a writing room staff. I mean, some may like that. I'm merely suggesting that sometimes you need to create whatever you want. fanfiction, reviews, whatever, and with an open internet, you can do that.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Well, we already know that it has desensitised people to things like racism and sexism. So I won't pretend that the internet as it is now is perfect. But with an open internet creativity is allowed to flow freer than anything else has in the past. For instance, I could conjure up a pilot to a sitcom, put it up on youtube, and I have an audience. I couldn't do that with television. I propose a question. Why would you forgo the opportunity to meet new, potentially great people online, no matter how safer it might be just to have big business protect you from them? The positives of the open internet far outweigh the negatives of the internet.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would only like to know how fast it goes, how transparent it is with my information. (I'm not exactly fond of the idea that someone is watching me, it's just unnerving.) And I would want the internet to just be left alone. I don't want it demonised, but instead, embraced. Yes, it's imperfect, most things are. But there are those who fear the future, and those who are open to it, and the latter usually prospers.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They shouldn't do any kind of throttling as this would be false advertising when an ISP (say Sky) say that they have the fastest internet. When in truth, they throttle you a lot. Ideally, the internet should work like water or electricity, nobody interferences with it, just have people pay for it. Like any other public service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's should not be monitoring people without a search warrant, and even then, people who had a history of doing unsavoury things online. It's not exactly ethical for them to be given police like powers just so they could look through what I do online. What happens is my business.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ein solcher Bedarf ist nicht gegeben. Mit Zero-Rating wird ein Kunde zur Nutzung eines Dienstes oder Angebotes gedrungen. Andere Dienste werden damit in Ihre Position am Markt gleich mehrfach beschränkt. Einmal wird es Ihren Kunden erschwert den Dienst zu Nutzen, andererseits wird Ihre Konkurrenz indirekt durch die Anwendung von Zero-Rating (in diesem Fall der bevorzugte Dienst) beworben.

Ein konkretes Beispiel ist ein von mir mit gegründetes Startup. Per App wird es Lieferunternehmen ermöglicht ihren Fahrern Tourenpläne und Artikellisten zukommen zu lassen, andererseits wird die gefahrene Route des Fahrers festgehalten und kann vom Unternehmen ausgewertet werden um effizientere Routen zu plane. Dazu ist Mobiles Internet erforderlich. Die Telekom selbst hat mit dem Unternehmen Novum eine Zusammenarbeit für diesen letzten Punkt, Tourenverfolgung und Optimierung (<https://geschaeftskunden.telekom.de/startseite/320442/novum.html>). Ein bevorzugen dieses Datenverkehrs wäre für unsere Kunden ein Grund auf das Produkt der Telekom zu wechseln und damit ein schnelles Ende für unser Startup. Damit würde lediglich eine Monopolstellung für wenige große Betriebe durch solche "kommerzielle Praktiken" gefördert, unabhängig von der Innovation oder dem Leistungsumfang eventueller Konkurrenten.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste würden Offenheit und Innovation beeinträchtigen. Offenheit wie auch Innovation bedeuten insbesondere auch das neue, noch nicht durch Spezialdienste optimierte Anwendungen oder Angebote gleiche Möglichkeiten haben müssen. Eine Spezialisierung auf bekannte Dienste würde diesen neuen Diensten von Anfang an eine zusätzliche Hürde auferlegen. Ein neuer Dienst würde indirekt beeinträchtigt werden indem bereits bestehende Dienste durch Optimierungen bevorzugt werden. Um diesen also tatsächlich aus Perspektive der Kunden der Telekommunikationsanbieter gleichwertig zu machen müsste auch der neue Dienst von Anfang an mit entsprechenden Optimierungen gestaltet werden. Das allerdings widerspricht dem Begriff "Spezialdienst" in seiner offensichtlichen Bedeutung. Es wird also durch die Einführung von Spezialdiensten eine Hürde für neue Ideen geschaffen und dadurch Innovation wie auch Offenheit ganz klar negativ beeinflusst.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Aus eben genannten Gründen: nein und keine. Dazu kommt noch die Notwendigkeit der bereits in einer anderen Frage behandelten "Deep-Packet-inspections" um Spezialdienste überhaupt umzusetzen und den Problemen beim Anwenden dieser Technik.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Eine solche Überwachung führt unweigerlich zu einer Verzögerung der Auslieferung der Pakete im ersten und kann einzige der Ungleichbehandlung der Pakete im zweiten Schritt dienen. Die Ressourcen welche für eine solche Inspektion notwendig sind können für alle besser in den Ausbau

der Kapazitäten investiert werden. Weiter ist nicht jeder Datenverkehr dadurch erfassbar. Insbesondere (aber nicht ausschließlich) verschlüsselte Daten können dadurch nur unzureichend klassifiziert werden. Eine fehlerhafte Einschätzung bei der Klassifikation hätte aber dann eine ungerechtfertigte Falschbehandlung des Datenpakets zur Folge.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Jede Form des Einflusses auf meine Datenübertragung durch einen Provider ist abzulehnen. Ob z.B. ein Video zum Vergnügen, zur politischen Bildung oder aus wirtschaftlichem Interesse übertragen wird ist für den Provider genauso wenig zu erkennen wie ob ein Anruf privat oder geschäftlich, eine besondere Dringlichkeit hat oder jederzeit wiederholt werden kann. Diese Informationen gehen nur aus dem Inhalt und dem Kontext hervor, welche dem Provider ohne ausgiebige Überwachung entgegen dem Datenschutz nicht in jedem Fall zur Verfügung stehen kann.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Mindestens folgende Informationen halte ich für essentiell:

- Übertragungsraten (Minimum, Maximum und Durchschnitt) in einer technischen und einer allgemein verständlichen Form (anhand von z.B. Beispielanwendungen die damit sicher möglich sind)
- Ausfallsicherheit (Durchschnittliche und maximale nicht Verfügbarkeit des Dienstes in der Vergangenheit)
- Alle Angaben sollen möglichst leicht nachvollziehbar sein. Das wäre zum Beispiel durch eine Providerübergreifende und einheitliche Nomenklatur einfacher, da hier ein potentieller Kunde leichter die verschiedenen Angebote vergleichen kann.
- Eventuelle Grenzwerte und der Umgang mit diesen. Auch hier sind klare Beispiele eine wichtige Voraussetzung.
- Bei technischen Problemen sollten dem Kunden alle Informationen die mit der Übertragung in Verbindung stehen soweit nötig um das Problem zu beheben angegeben werden.
- Bei mobilen Netzen: Die Abdeckung (Fläche) des Angebotes nach Möglichkeit auch innerhalb eines bestimmten Bereichs

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht dieser Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den

Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Andreas Voeth

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Dr. med. univ. Alexander Egkher

University/Medical University of Vienna - Austria

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised service has no need in nowadays with powerfull data-highways. It is a tool to controll and - then manipulate the mankind!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no such demand. This is marketing speak to justify trampling on people's rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

An open Internet is crucial to the growth and innovation of all civilized countries.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. People have a fundamental right to privacy, online and in real life.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should only be able to deliberately interfere with paid service in the cases of confirmed criminal activity.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Voice over IP might be allowed special treatment as a class of service due to low latency requirements. However, all VoIP traffic - independent of the provider - should receive the same quality of service.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I would prefer ISP to treat all traffic equally. Zero-rating favors certain market agents and creates a hostile environment for competition.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISP should treat all traffic equally.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All connection parameters should be easily accessible for customers.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I'm not exactly clear on this.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: Encourage competition among providers

Negative: Limit Internet activities of citizens of lower incomes.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't think so.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The last thing the Internet needs is "traffic management." The Internet was set up to facilitate creativity and artistic expression. All great ideas have had their origins in grassroots creativity. Creativity has always come from the ground up--not the other way around. If you should ever inhibit this creative process in any way, you will lose grassroots participation, and your money-making Internet will become a dry and sterile place, indeed.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Should NOT be able to do so.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't believe that any customer wants discrimination of any kind in their service; zero-rating Netflix for example penalises other streaming media providers and has no technical basis, as they all operate using the same basic technologies. ISPs don't need to know who I'm connecting to, why, or what I'm downloading; their sole view of my traffic should be in the form of UDP/TCP packets.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Free services will be arbitrarily penalised for being unable to pay for zero-rating, it will also create an increased barrier to entry for smaller companies as users will avoid them in favour of services that cost no additional money.

That said, bandwidth caps in general should go away entirely, as there is no real basis for them and zero-rating is only a thing because of them.

Is there a demand for specialised services? Which services should be allowed this special treatment? No and none. All of my routers and switches over the past 10 years have supported some form of Quality of Service to improve performance of streaming media and so-on, nothing additional should be required at the ISP level.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. If I'm using too much bandwidth then throttling is understandable, but it shouldn't matter what I'm using that bandwidth for; if my rate is lowered than Quality of Service will handle the rest.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. If my packets have Quality of Service values then they should respect those, otherwise everything else should be treated equally.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it, and it should be provided clearly and easily during purchase.

I'm currently with Virgin Media but was deeply disappointed to learn of their throttling behaviour, which essentially limits me to about an hour or so of full-speed access before my rate is lowered to 25%; since I can't easily limit the speed of some apps this means I can become throttled just by downloading a single episode of a TV show, which is just arbitrary and inflexible. This wasn't a condition under Telewest (who I originally signed up with and were bought by Virgin Media).

If I were buying a new connection today I'd be very wary of anyone that has traffic limiting of this type, and I don't think it's fair for "unlimited" internet to hide their traffic management policies in some FAQ or support document somewhere.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, das möchte ich nicht.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Ich möchte selbst entscheiden können, was ich mit meinem Internetanschluss mache, solange es nichts rechtswidriges ist. Ich zahle für eine gewisse Geschwindigkeit. Diese möchte ich jederzeit nutzen können und nicht von "oben" oder "hinten" .... dirigiert und beeinflusst und bevormundet werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
A. Robeck

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

No, no, no to infinity. The US government gave internet technology to these present providers. The providers agreed to providing internet service to certain designated areas for all its customers. They have not provided this and the government has not enforced it. The internet is there to provide service to its monopolized area customers plus a small profit just like public telephone service to the population. The internet and/or telephone industry was never meant to be commercialized. It is supposed to be for the common good of the country's citizens, not to make billions of dollars for a commercial entity.

My name/organisation:  
Joyce & Jerry Hansen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

No "specialized services" should be offered ever. All ISP customers have the same service for the same price not "specialized service" for those who can afford the extra money it will cost them. "Specialized services" will limit access, competition, innovation and increases the power of the ISP monopolies.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There can be NO "specialized services". If there is demand for "specialized services" they should not be considered "specialized services" but be provided to all customers of the monopoly ISP to all its customers for the same price. Without this, we would not have a free and open (not optimized) internet and lack the freedom we now have to make our own choices. "Specialized services" would bring the demise of our free /open internet, which is what happened to our free television that we used to have. Television is almost dead because of its monopolistic practices.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is NO Positive impact for ISP customers. Only a limitation of services and choice. The positive aspects of "Positive impacts" is more money, power, profits and control of customers and content for the ISP's, which would eventually lead to it's demise, just like television. Someone in the future will invent something better than the internet that is not monopolistic because the people. customers want freedom of choice and monopolies do not allow that. That is why it is so important to keep our internet open and free with no monopolies.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Commercial practices already do limit my rights as an end user. ISP's are rich, strong, powerful

monopolies that try and do make their own rules, to their benefit, not their customers. No ISP customer can compete or use their rights even now. But, the purpose of the internet is/was to enable democracy and the ability to compete with one another openly. No ISP customer can compete with an ISP, but they should be able to compete.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No government, intelligence agency (including police, FBI, NSA, etc.) or ISP should ever be allowed to read, monitor any ISP customer content or data/transmissions (for any reason). If an ISP, government agency, contractor, etc. wants access, they should be required to get a warrant from a US court (judge not fisa) after they present specific evidence such warrant is necessary and the warrant should specify the information, evidence that they specifically will be looking for. No open warrants.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

There should be NO interference allowed. All internet connections and service should be equal for all. There should never be a prioritization or de-prioritization, period. ISP's should provide excellent service to all and every customer.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, it is both limiting and discriminatory for everyone and should never be allowed!

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users?Please, provide examples.

ISP providers should provide their customers with adequate infrastructure and technical expertise so that traffic management would never be necessary. This is what ISP profit is for, to improve infrastructure and services, not to just pocket all profits.

What information would you need to make an informed decision about your Internet connection?

For example: traffic management; commercial practices or technical conditions?

Traffic management, commercial practices or technical conditions are parameters and information that should be provided to customers by the ISP, as long as they don't violate any laws or net neutrality. ISP customers and their providers should work together using best practices.

What information would you like to receive about the speed of your Internet connection?

Anything about speed (upload, download, etc.) that might help me utilize speed and maximize it.

250kb of speed is what we are stuck with, with our ISP monopoly. I've heard some have as much as 2gb for speed. Monopolies don't provide that here.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, all parameters should be defined in the contract. It should be written in easy to read and understand language and have a way to contact a "knowledgeable" customer service representative that fluently speaks your native language.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir or Madam,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
NONE.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positive Impacts, only negative ones.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NOT at all !

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Geringe Leitungsgeschwindigkeiten, wenn Leitungen von Lobbyisten freigehalten werden!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Man ist als Bürger noch gläserner

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?

Kein Bedarf an Spezialdiensten

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Es soll überhaupt nicht vom Internet-Provider gedrosselt werden!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Geschwindigkeit, Traffic-Management, Quality-of-Service

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Thomas Volkmann

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, all interference in internet access limits my freedom of speech and ability to make informed choices

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can't see any possible positive impacts

Is there a demand for specialised services? Which services should be allowed this special treatment?

No demand here

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, we need to keep the internet as open as possible in this age of government surveillance

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

High-speed internet should be viewed as a basic right and kept free of all management

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Mike Benson

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I do not believe that certain services should have special treatment at the detriment of individual use of the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Price discrimination offers access to limited parts of the internet and discriminates against freedom of expression and communication and stifles competition and innovation.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating limits the free expression and communication of individual users. This violates the object and purpose of the Regulation in safeguarding open access. Commercial use of the internet should not allow certain services or traffic to be prioritised or restricted.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

How individuals use the internet should be determined and regulated by each individual's choice. An ISP should not be able to prioritise certain types of traffic or to limit other types of traffic.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Monitoring the content of individual traffic on the internet is an invasion of personal privacy and liberty. The whole concept of the internet from its origins was to foster free exchange and sharing of individual information, perspective and opinion. These ethical principles must be maintained and "free speech" upheld.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

There should be transparency in access to information about each users internet connection, such as speed, quality and management.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Dr Ray Lightbown

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Only valid for provider-related services, not for third-party services (e.g. facebook).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Kill diversity of the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? Demands of services changes overtime, so no one should be allowed any special advantage.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The more, the better.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Andrea Siro Magnani

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.

Si, me parece altamente discriminatorio hacía el usuario, además creo que las operadoras deberían de enfocarse únicamente a mejorar velocidades, precio y ping

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

Ninguno

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

No, que lo hicieran de forma anónima ya me parecía poco ético

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

Absolutamente nada yo estoy pagando el tener un barco con X velocidad , no quiero que cobren + por ir a un sitio u otro

¿Qué información te gustaría recibir respecto a tu conexión a Internet, por ejemplo sobre la velocidad, calidad de servicio o cómo se gestiona el tráfico?

Calidad y velocidad como mucho

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina

entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ideen im Sinne eines "Zero Rating" sollten keinesfalls für kommerzielle, sondern allenfalls für unkommerzielle, gemeinnützige Dienste, wie z.B. Wikipedia gestattet sein.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Internet-Provider sollten z.B. nicht das Recht haben, E-Mails sprachlich zu analysieren oder Verhaltensprofile aufgrund der individuellen Präferenz der besuchten Webseiten zu erstellen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Ein Internet-Provider sollte nicht die Möglichkeit haben, bei der Nutzung des Internets bestimmte Datenübertragungen gezielt zu benachteiligen oder zu bevorzugen, zumindest sofern es nicht um eine richterlich angeordnete Verhütung von Rechtsbrüchen geht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Als Internetnutzer möchte ich über Geschwindigkeit und Quality of Service in transparenter und differenzierter Weise unterrichtet werden. Ich möchte realistische Angaben (Durchschnittswerte) und Beispiele für das zu erwartende Funktionsniveau gängiger Internetdienste (z.B. Internettelefonie) erfahren.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Tilman Vogel

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there is no need for the zero-rating to end-users. On the other hand, it is clear that this will inevitably drive users to zero-rating services/app and introduce an artificial bias on interaction between users or customers. This potential outcome is strongly desired by some institutions as a tool for monopolization.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I fail to see any long term benefit from specialised services. In fact, I see the opposite, a plethora of negative impacts, which will exacerbate bias on opinions and consumer trends. This as the potential to generate a major negative impact on critical thinking and innovation. For innovative products and solutions to succeed we need not only people thinking out of the box, but also a platform where information is equally accessible to all, regardless from the dimension of the entity, person and or company behind any content.

Is there a demand for specialised services? Which services should be allowed this special treatment? No, I do not see demand such services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, ISP must not be allowed to monitor clients and other users information, including metadata, for the purpose of traffic management.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They must not be allowed to interfere with internet connection.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

In addition to speed and quality of service, ISPs must declare how often and on which basis they read and/or costumers data with third parties.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is a demand primarily from large scale content providers however this would be very detrimental to the consumer's internet experience.

I should not have my ISP deciding what parts of the internet I should have access to based on where they will make the most money.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

All portions of the net should be treated equally.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

By having the ISP deciding which parts of the internet to prioritize you are already biasing the user experience against all other portions of the net and thus potentially stifling innovation as smaller companies/websites would not have the priority.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I believe the consumer should not have any information hidden from them.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. ISPs monitoring the content of my traffic is a violation of my privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I am quite sure these practices are in the interest of some firms. But they are working against the great majority.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It will become less useful, and most people will notice it.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't know if there is a demand. I am against them.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd like to have such information easily available and be sure of its reliability. (I don't want it to be rammed down my throat.)

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

John Meade

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No way.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Cory

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

ISP's are creating a demand for zero rating schemes, as they have chosen a "winner", and we as end users will either use the chosen service or suffer huge overage bills from our ISP.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"Specialized services"? That sounds like another way for ISP's to pick a winner and provide content faster for those chosen few. It means slow lanes for those who will not, or cannot pay their extortion fees.

Is there a demand for specialised services? Which services should be allowed this special treatment? There is no end-user demand for special services. We want equal access to all sites. No one should be allowed special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I believe in the privacy of users and their internet traffic. Anything less is not only an invasion of privacy, but steps towards a spying state.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Zero interference

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know the speed I am paying for, and if there is any sort of traffic management, or websites being blocked.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If a provider is able to make it harder to access the services they don't profit as much from, and make access easier to the ones that profit them more, there will be no such thing as free and open communication on the internet. Imagine if your phone service was harder to friends and easier to businesses.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any time we allow special service at a higher cost, it will dilute the access and speed of the rest of the users. We need to attain and keep good access for all before anything else.

Is there a demand for specialised services? Which services should be allowed this special treatment? Emergencies, some kinds of health and safety information, alerts to dangers. Never simply for profit or convenience beyond the services already available to everyone.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only in emergencies, just like an ambulance needing to get through.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Yes, and it should be plainly stated and easy to understand.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes this absolutely would impede on my rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

This is a much more logical approach to traffic prioritization.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Medical services and certain government operations.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Prioritizing internet traffic is a slippery slope that can quickly result in information suppression. We cannot begin down that slope.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No I do not believe any entity should be able to monitor massive amounts of online content.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating should not be allowed. No service should get privileges over any others. That would allow rich customers to undermine civic forums, individual users, small companies, etc.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The Internet must remain free, open access, uncensored, and neutral. Nothing else is acceptable. Rich telecoms should not be allowed to run roughshod over small and individual users.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No special treatment should be allowed.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP's should not interfere with content or be allowed to give faster speeds to premium customers. The Internet is a PUBLIC UTILITY and should be regulated as one.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Big dogs get bigger; smaller dogs remain the same size--or wither.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
The demand is supplier driven.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Yes, as long as the owners of the ISPs allow me to monitor their Internet usage.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All information available to the ISP itself.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
none

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Wenn nur gegen Geld ein schnelles Netz frei geschaltet wird fallen alle andern nach hinten.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, meine Daten gehen keinen anderen was an.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Jeder soll Video streamen können aber muss keine Bibliothek laden können. .

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann

nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Marie Christina Magalas

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\* Very few: Emergency calls, warnings about earthquakes or nuclear powerplant issues etc. It is debatable, if this really needs special treatment at all.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\* Zero-rating harms startup companies and non-commercial offerings.

In the end, zero-rating shifts the payment: The ISP is no longer paid in terms of money only but also in terms of bound customers.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No way. My data is my private issue. This may not be analyzed by any private company. Also secret services / police should be allowed to inspect anyone's traffic only in individual cases under strict regulations (e.g. quick freeze). NO inspection without a judge being involved for that particular individual case. Everything beyond that harms the society (which is currently happening).

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\* This is something my DSL modem can do as well, if I have demand for that. The ISP shouldn't do anything here.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I believe that zero-rating could potentially cause the small user such as myself to experience serious slow-downs.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The positives would all belong to the high traffic, the corporate and the rich. The negatives would mean the small end-user would have a difficult, negative, obstructed, slowed experience.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I think that there are large companies trying to push through laws which would favor them.

Emergency services should have a fast-lane. There would need to be standards set for the designation of being an emergency service, to avoid it becoming just another loophole for the rich and powerful.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The internet needs to be an open highway, without tool-booths.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Those parameters, (speed, how my traffic is managed, etc.), would be good information to know in order to make decisions such as those in this questionnaire.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I see no demand. I wish a fair-flat for all usecase.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I don't know what a special service should be. I think there is not enough netneutrality in the European Union right know.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not much. Only critical stuff.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I wish information about speed, quality of service, traffic management and minimum bandwidth.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

This would be a severe invasion of privacy, and possibly criminal. It would inevitably result in more bothersome "spam" in e-mail and likely more paper mail as well.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should operate in the public interest primarily, and not be allowed to favor users on the basis of profit or business relationships. The Internet was created with U.S. taxpayer money, and given away to the world as a benefit for ALL, not just corporations.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Steve Ditore

---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Not among the people. Which is obvious from its name. The very name of the service is "Specialised", meaning that it only exists to serve specific individuals. For the vast majority of internet users, such a service would only serve to hamper their experience.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If there are sections of the internet that can be "walled off" because you or they do not have sufficient "subscription" or haven't paid enough money to get into the "fast lane" of the internet, then your ability to research and to gain information is lessened. Less available information means less innovation and advancement by simple virtue of the fact that a major component of any invention is research into existing products and services and the ways in which they fail to meet a demand or demands.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None. I don't care if there is an emergency or if they're simply being offered more money by someone else. I'm paying for a service, and a contract which we've established, and I expect that to be honored.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Absolutely. Such information should be readily available.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. It's the same principal as somebody having the right to listen to my private phone calls, read my mail, read my email, browse my personal files on my computer, read my journal, etc etc, without my permission. It's an invasion of my privacy, and even though I feel I have nothing to hide, I also believe I deserve to have the freedom to choose who does or does not get access to my personal information.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
Kevin Dulnik

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

A concerned citizen

Didier Eeckhout

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Patrik Neu

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

When there are specialized services, they take up space for future innovations, so those will not be able to establish.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It is not good for other services providing a similar product. New companies will not be able to get users because the user is tied to one service. No user wants to use a service which is not included when there is one offering a similar product and is included. An example would be a music streaming service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

This is a deep insight in the privacy of a person and should be prohibited.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

When doing this your right on internet will get harmed and one will not get the freedom offered by the internet.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Unsure

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed, quality, traffic management

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Die Einführung kommerzieller Praktiken ist das Ende des "freien Internets".

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Finanzstarken Teilnehmern wird Tür und Tor für Manipulationen aller Art geöffnet.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Ich sehe keinen Bedarf.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Die tatsächliche Up- und Download-Geschwindigkeit.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Gerhold Reitmeier

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele, wenn, dann ausschließlich für mobile Internetverbindungen

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

es wird eine eklatante Verschiebung des Traffics hin zu wenigen großen Anbietern geben. Diese werden folglich weitgehend die zur Verfügung gestellten Informationen kontrollieren

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Audio und Video Streaming sollte problemlos ermöglicht werden, aber den gleichen Stellenwert besitzen wie jeder andere Traffic

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, auf gar keinen Fall

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Die tatsächlich erreichte Geschwindigkeit

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

not sure

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

not sure

Is there a demand for specialised services? Which services should be allowed this special treatment?

not sure

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd like to know as much detail as possible about speed, quality, and the management of traffic.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
James Frenkel

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Johann-Nikolaus Andrae

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I did not know any. All examples i heard i can not follow.

The Internet capacity is always limited. Specialized services did not fix it. A innovative idea has to deal with the limitation. Specialized services restrict the bandwidth to the money.

No. This is limited to a small set of services. You could not easy change the provider and still use the same (zero-rated) streaming service. I can not use my own streaming from home.

No! Way do they do this? This is my privacy. They can can count the traffic for the billing. All data are to handle equal and need no additional monitoring.

Way should not interfere in my Internet connection. I pay for a fix bandwidth to the internet. I expect the DSL part is the limitation of the speed. The traffic has to be manage by my home router not by my ISP. If my ISP do his work there is no need to throttle some services.

All information influencing my internet connection. Especially all information they have about way i did not reach the maximum speed in general and for special service.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-rating zwingt mich unbewusst dazu nur die Dienste zu nutzen, die mein Datenvolumen nicht belastet. Alle anderen Dienste muss ich dann ja faktisch bezahlen durch mein gekauftes Datenvolumen, dass ist kein neutrales Netz meiner Meinung nach.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Wenn Spezialdienste erlaubt sind, gibt es keine Innovation mehr. Ein Startup kann sich nur selten das Geld leisten den Status Spezialdienste bei allen nötigen Providern zu kaufen. Auch prozentuale Beteiligungen sind schwer möglich. Wenn 10 Provider nur jeweils 5% Beteiligungen möchten ist schon die Hälfte des Gewinns weg. Das hoch gerechnet auf alle relevanten Provider zeigt den Unsinn. Nur mit einem freien Netz ist Innovation möglich.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Keine

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Live streams von spielen oder Videos und ähnliches sollen schneller übertragen werden als z.b. E-Mails. Aber grundsätzlich sollte alles gleich behandelt werden.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Übertragungsrate im Schnitt, maximal und minimal auf einer Zeitskala.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das

Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Benjamin Weinheimer

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all. This will change the nature of access to information and further enhance the false reality that the internet is already in danger of creating.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Timothy Biel

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't think there is a demand for "zero-rating".

This will lead to limit my rights as an end-user as I should get my internet free of throttling and at a competitive cost and not too expensive like it is right now.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positive impacts on this but an example of a negative impact is low budget users like my self and a lot of other people around the world will be limited to provide a great service they could provide if these restrictions are placed. Services like in example, hosting services, live services, webinars etc.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't think there is a demand for "specialised services". No services at all should be allowed better than others. All should be treated equally.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None. Zero. Shouldn't be allowed at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I use speedtest a lot when my internet is slow to make sure my ISP connection is not the problem. Knowing your speed is a vital when it comes to internet.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Das Internet gehört der gesamten Menschheit. Niemand hat das Recht, Den Datenverkehr zu zensieren, zu beschränken oder gar zu verändern.

Kommerzielle Dienste sind geduldete Nutznießer im Internet. Das sollte man diesen Herrschaften deutlich machen.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Eine Regulierungsbehörde impliziert, dass die Beschränkung bereits stattfindet.

Dies darf nicht sein, da wie gesagt das Internet ein Geschenk an die gesamte(!) Menschheit ist.

Eine Regulierung ist nämlich immer auch eine Zensur.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Mit Ausnahme des Katastrophenschutzes sehe ich absolut keinen Grund für eine Bevorzugung von bestimmten Diensten.

Alle Probleme ließen sich vermeiden, wenn der Provider jedem Kunden genügend Bandbreite zur Verfügung stellt.

Dazu sind Shared Media (wie LTE) nur bedingt geeignet.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Zugangsdaten, Geschwindigkeit, meine Verbindungsdaten jederzeit, info ob und wie lange diese gespeichert werden.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein! Auf gar keinen Fall.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht. Der Provider soll Daten Transportieren. Mehr steht ihm nicht zu.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es

ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Hajo Heyen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not sure

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Not sure

Is there a demand for specialised services? Which services should be allowed this special treatment?

Don't know

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It shouldn't

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I just want it to work at a reasonable speed

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Absolutely not from an end users point of view.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No there is no end user demand and it absolutely limits your rights.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No traffic shaping or throttling or port blocking should be aloud for a free open Internet!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

A fully transparent breakdown.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No as DPI is a breach of privacy full stop!

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Netflix is an example of a service that could potentially never flourish if restrictions on the open internet are pushed through. New companies bringing fresh concepts to the market will be stifled by the fact they can never compete with a larger corporation who can run their content through a "fast lane"

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I disagree.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

An open internet brings access to more people and innovators. A closed, corporate internet stifles innovation and limits the ability of disadvantaged communities to access the internet forever.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Not sure!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! ISPs should not be able to monitor the content of a person's traffic. The right to be forgotten.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not have the right to throttle a persons traffic such as video and P2P etc

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Consistent and dependable speed

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
John Maskell

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Marco Bratz

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None, all ISP users deserve equal treatment.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
Startup services would suffer.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Speed, quality of connection and info on competitive connections around me and around the world.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Absolutely no!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, it shouldn't.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices - such as zero-rating - by the ISPs should be prohibited by law!  
These practices would strongly affect the users choice of offers made online.

To illustrate an example I'll try to transfer commercial practices to the car market.

E.g. governments can choose to subsidize certain things like electronic cars to stimulate the market. But if they do so, they can't just do this for only one company like Tesla. Because then they would discriminate other car-manufacturers which also sell electronic cars. More people would buy a car from Tesla instead of considering others, just because that's more profitable for them.

Another example would be special driving lanes. Imagine car-manufacturers like BMW could buy licenses for special treatment of their customers on the road. Then only people driving a BMW could use these "fast privileged" lines. Others driving a Fiat would have to wait as twice as long on traffic lights, because their manufacturer could not afford these "special services". This would result in more people buying a BMW instead of a Fiat, just because BMW bought a "special treatment" by governments.

The consumers' behavior would be strongly affected by this! Other companies which can not afford these "special treatment" would be intentionally handicapped.

With commercial practices on the Internet that's exactly the same. Big companies like Facebook and Google would be able to buy these services and therefore the ISPs would give them a privileged stand. No one would use a competitive search engine like Ixquick or Bing, because this would - in terms of zero-rating - cost them traffic capacity, which they only have 200MBs of. But Google searches or Facebook videos would not affect this capacity of theirs. (to be exact Google etc. aren't search engines: <https://edri.org/eu-decides-that-google-is-not-a-search-engine/> because they don't list all crawled sites)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Many ISPs like the German Telekom are also providers of content like video-streaming and news. If ISPs are allowed to give their own services more quality than services provided by others, they would be able to push other content providers aside. ISPs could make services by other suppliers - e.g. video-streaming - on purpose unusable. This way they will build a monopoly-like business model.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
The ISPs should NEVER be allowed to "specially treat" ANY service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

My ISP could be allowed to count my traffic in general, but he should NOT be allowed to count the traffic individually for every source of my traffic.

There should never be any other exception than managing my overall pensum.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It should be strictly forbidden - especially for ISPs - to interfere with anyones Internet connection!

There should NEVER be any prioritised traffic. Prioritization harms the competition of providers with different approaches of services like videochatting via P2P instead of using a Client-Server model.

New uprising technologies, where the Internet plays a key position in transporting information, could never replace the old ones. E.g. the future of internet services is heavily beased on P2P applications and technology. So if we allow ISPs to neglect certain types of online traffic, this would be a strong distortion for the online market.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd like to know the maximum and the minimum speed of my internet connection in an user-friendly way. Now my ISP only tells me my connection has a maximum speed (downstream) of 16.000kbit/s, but I never got over 14.500kbit/s.

Also this kbit/s allegation is not clear for the average internet user. Please show this in a more user friendly way like 1,5MB/s. That is more understandable for the average user.

Also my ISP should be forced by law to inform me of any traffic management - like deep-package inspection or zero rating. They should be forces to display this publicly on their website so every internet user can compare ISPs and how they limit the users traffic online.

The big problem today is that most internet users don't know about what their ISPs are really doing. Even if it's mentioned in their contract the user can't really see how strong their intervention with the traffic really is.

It should be easier to compare ISPs in terms of net-neutrality. This way the end user is able to choose the ISP, which is acting – in terms of net-neutrality - like she/he wants.

(If consumers only see the maximum speed-limits and the price, but not the minimum speed-limit or how heavily the ISP is fiddling with net-neutrality, they can't choose in their best interest; no average consumer wants/can to read thru 100 pages of contracts by 5 different ISPs; also if they got the time the contracts are mostly opaque and ambiguous)

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have always believed that when ISPs and other commercial enterprises who have software installed on my computer to enable their services to work then the downloading of this software and all subsequent updates should not become a burden on the user. After all the ISP or other commercial entity is already making a profit from the services they provide so any additional charges should be met by the provider and not the customer. Why you might ask? It is because to use certain commercial entities services requires software and the users would in effect become captive (and dependent) customers who would have no say in the issues of cost and charging ie zero-rating or not. They would be effectively being blackmailed. ISPs and others already make a massive fortune out of the internet. The additional demands ISPs are making are simply plain greedy. Economic growth policies are the root cause of this drive to make more profits and it is economic growth policies that are trashing the planet in numerous corrupt ways.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The only positive is if zero rating of some services such as software upgrades applied across the board to all software upgrades (see previous answer). There are no negatives to net neutrality other than stopping the ISPs from making an obscene profit (which would be a negative if you were an obscenely greedy ISP).

Is there a demand for specialised services? Which services should be allowed this special treatment? See previous answer/point made.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs should not under any circumstances be allowed to 'Snoop' on my (or anyone else's) personal traffic for what they laughingly call 'traffic management'. It is just another way of prioritising and targeting advertising to increase their profits whilst slowing down what I am trying to do online. By targeting advertising and installing other deviations from my chosen search requests the ISPs are manipulating my use of the internet to suit their corporate agendas and this totally flies in the face of net neutrality.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Net neutrality is net neutrality. No ISP should be allowed to influence or interfere with my connection or with anyone else's connection to the internet, especially when that interference diverts the user away from their original purpose for the sole profit of the ISP.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

In my area of the UK I am 3 miles from an exchange yet my internet speed is less than 2 Mbps. This is still incurring a monthly charge the same as the people living near the exchange who have an internet speed close to 10 Mbps. The disparity is hidden within corrupt marketing and slack legislation which allows ISPs to sell a service based on the slowest speed and but priced at the highest regardless of whether or not the user can obtain the highest quality service. Again the ISPs are making a killing based on this disparity and nothing is being done to level the playing field. This must be a part of net neutrality. Level plying field for all with no special pricing for any services. One cost and one quality of service. If its 10Mbps for the best then it should be 10Mbps for everyone.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No !!

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No - the Net should be established in legislation as a public utility which protects individual citizens' privacy, and does NOT allow corporations unique access or powers or privileges.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Regulations which would allow a discriminatory "fast lane" for services that could be provided on the open Internet must be avoided - this protects freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? This is unlikely, and opens the door to subverting the internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! The Net is a public Utility - It has to be protected ESSENTIALLY in such a way to protect personal privacy - now and in the future.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None - the Net needs to be enshrined as a Public Utility utilizing private distributors.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Full transparency AND access to timely service to correct quality of service.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I do not see a value to zero rating to the consumer. It seems designed to add complexity where none is needed. This is usually the tactic used by corporations who are attempting to maximize profitability in the medium to long term. When they add more choices, they put the responsibility for making the wisest, cheapest choice on the consumer, and profit when they don't.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

By creating complexity where none is actually needed, through specialized services that have no real value, ISPs create an opportunity to exploit consumers. But these specialized services don't add value, or solve real problems for the consumer.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs do not need to monitor traffic to do their job.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs do not have a need to prioritize traffic. The purchaser has the right to the bandwidth they have agreed upon with the ISP. How they divide it should be up to purchaser, and controlled by their own router / access point software.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.

No a lo primero, sí a lo segundo

¿Cuáles pueden ser los impactos positivos y negativos de los servicios específicos en el futuro de la innovación y la apertura de Internet?

positivos: libertad de comunicación, la competencia y la innovación

negativos: ninguno

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

No, a ninguno

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

NO, NI EN SUEÑOS

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

NADA

¿Qué información te gustaría recibir respecto a tu conexión a Internet, por ejemplo sobre la velocidad, calidad de servicio o cómo se gestiona el tráfico?

explicaciones transparentes; velocidad media disponible de tu conexión, especificando también la velocidad máxima y mínima, de manera comprensible, por ejemplo a través de un diagrama o imagen. También, información sobre posibles problemas que surgen al utilizar las aplicaciones de VoIP, tales como retrasos en los vídeos o los efectos de sonido.

Básicamente, debo poder tener toda la información necesaria para poder hacer suposiciones razonables sobre la calidad del servicio de que dispondrás para tus prioridades particulares (juegos, vídeo, etc.).

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta

fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Kind regards,  
JUAN PABLO

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be able to interfere at all. I'm already paying for their (sometimes downright deplorable) services and I still occasionally have connectivity problems. If they start interfering with it on purpose I might as well not use them at all.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

People with good ideas could be ignored, because they can't pay enough. Democratic and social justice organisations, as well as non-profits will be at a disadvantage. Also, a lot of people will be criminalised for finding ways around all the ISP's. If we're limiting the internet by law, people will ignore that law, because it is unjust, you do not need a law degree to know that.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It depends on the individual. It should not be mandatory (by making it the only service to choose), is all I'm saying.

Is there a demand for specialised services? Which services should be allowed this special treatment? Only emergency services at time of need/imminent danger. It should not be a regular thing for them either.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. I may, if I'm in a generous mood, accept my ISP to know the data volume I use, but they should not be allowed to know the content.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There should be no such thing as zero-rating!

This leads to a wrong and biased market. If e.g. there is a competitor to 'spotify, netflix, maxdome, etc' and the traffic of the competitor does count towards my traffic, and spotify's etc does not, then spotify etc is the more attractive option for the consumer.

But the thing is, e.g. ISPs have their own services like that, and of course they then don't count towards my traffic. Then this is not a fair market where the consumer can really decide, because the ISPs service has an advantage right from the start.

And a competitor is at a disadvantage which most of the time cannot be overcome, because the big companies are at a really big advantage.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is the big negative, that everything new cannot even start. When the specialised service is right out of the gate at a advantage over every alternative.

I cannot think of a positive impact, for the consumer or the market. The only positive thing is when you are an ISP you get to keep your power and kill every alternative right at their starting point.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I cannot think of a service that should be specialised.

There is always the example of hospital and car services. But this is a false example.

These services don't use the internet as we are speaking about it.

And even if, which they are not, the delay here is milliseconds.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

ISPs are private companies, can could misuse the data gained from this, in the simplest way just for their own benefit and profit maximisation. Which all this is actually about.

If we compare the internet to the street, and i e.g. drive to a concert should i be treated differently than when i'm driving to the mall?

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Just in one way.

If i pay for a connection with the speed of 30Mbit then everything sent should be treated equal, with that speed. If i pay for 100Mbit, then everything, and i mean everything is treated at that speed.

There should be no checking of what i send or receive! And no throttling of certain traffic. If i pay for XY-Mbit then i get XY-Mbit for everything i do.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Apart from the obvious of price and speed, what they are doing with the packets. Such if they are inspecting them. Or if they are throttling it.

Which should not be done.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Oliver M.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The negative: favoring larger corporations would discourage awareness of new ideas produced by individuals and small start ups, simultaneously retarding innovation and user choice.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
not sure

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, ISPs should not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

would like to know how traffic is managed. Also comparative quality of service

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, ISPs should be providers only. They should not be gatekeepers or monitors.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be allowed to interfere with their customers' internet connection in any capacity.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices is an undefined term created to designate so called inferior information into worthless transfers. As a limited private end user I cannot afford the punitive pricing structure of prioritized information lanes.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Throttling information transfer is throttling human creation. By exchanging information we collaborate and create.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Guillaume SIMON

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

For privacy concerns, DPI is unacceptable.

Furthermore, allowing it would encourage crypto-anarchy

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It shouldn't for three reasons.

- There is no objective criteria allowing us to advantage or disadvantage some kind of traffic for the common good.
- If one wants, for privacy concern, encrypt her traffic (SSH-tunneling, VPN), its nature would by nature be impossible to identify and it would be systematically low-prioritized.
- If one want to open her own service with uncategorized traffic, it would be low-prioritized, preventing it to compete fairly with similar well categorized services.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich sehe eine recht große Gefahr bei solchen kommerziellen Praktiken. Zum Einen wird eine Konkurrenzfähigkeit für neue Unternehmen gänzlich unterbunden, wenn beispielsweise ein Streamingdienst "Sonderrechte" bei den größten Providern hat. Zum Anderen wäre der nächste Schritt, dass diese Dienstleister vom Provider fordern, dass andere Dienstleister eingeschränkt werden.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, denn ein Provider hat nur die Aufgabe, eine Internetanbindung mit vertraglich geregelter Leistung bereitzustellen. Fängt dieser nun an, den Inhalt zu überwachen und die bereitgestellte Anbindung zu verlangsamen, weil er bestimmte Daten ungern in seinem Netzwerk sieht, ergibt sich schnell die Möglichkeit, dass auch ungern gesehene Meinungen weniger schnell verbreitet werden. Gerade Text ist leicht zu analysieren, sodass dies schnell ein Problem werden kann.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Mein Internet-Provider soll meinen Anschluss nicht beeinflussen dürfen, da hierdurch mein Nutzen der Anbindung eingeschränkt wird, denn als Informatiker experimentiere ich oft mit nicht alltäglichen Anwendungen, welche dann leicht einer Drosselung unterliegen können.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best

Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Carl Richard Theodor Schneider

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes these limit my rights.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of specialised services which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open internet must be avoided. Freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Do not know.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Information I need to make reasonable assumptions about the quality of service.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Thomas F. Luce

When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
ATVIRTUAL.NET KG

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:  
Nina Röcklein

I feel surveilled when cooperations are allowed to look at the contents of my internet packers. My communications are no ones business. I am not able to express my opinions freely on the web when I feel monitored from all sides. Surveillance always leads to self censorship and is deeply undemocratic in every way.

ISPs should not decide which traffic is "good" and which is bad. Technologies like torrents are frequently discriminated against by ISPs because "There're only the evil pirates using torrents" but I have many legitimate and completely legal uses for torrents. Therefore I do not like to see this kind of discrimination against very efficient and decentralized technologies.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Nein, kein Bedarf. Es wird immer lokal optimiert um das bessere Geschäftsergebnis zu erhalten und nicht um der Gesellschaft die bessere Entwicklung zu ermöglichen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Spezialdienste, welche die Kapazität der Netze aufzeigen, sollten als Anlass genommen werden, die Netze auszubauen, statt zu reglementieren.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, QoS sollte auf Anschlussebene durchgesetzt werden.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Nur nach selbst bestimmten und bewusst eingeschaltetem QoS.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Zeiten, in denen das Netz meine maximale Anschlusskapazität nicht auslasten könnte.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Bastian Seehaus

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't think Zero Rating is a Tool to accomplish more and better Internet for all People.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I bigger Companies are able to use Money to gain an advantage it is bad for everyone.

Is there a demand for specialised services? Which services should be allowed this special treatment? There might be a Demand for specialised services for Medical Applications, I can't think of something else.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I want my ISP to leave my Traffic alone.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's shouldn't use Deep Packet Inspection at all. My Traffic is none of their Business.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There are clear conflicts of interest when an ISP offers television or VOIP services, but tampers with customers wanting to use competing services from other vendors.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Free access to The Internet is of primary importance, any other services providers want to offer should be secondary at best.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't personally see any, I can allow that some are possible, for example home medical equipment that needs 100% availability.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Only the bare minimum necessary to guarantee quality of service - clearly not to profile my behavior, or punish competing services.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Presumption of innocence should extend to use of the connection, no interference should be allowed unless it's to prevent unambiguously illegal activities.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd like to see hourly graphs of up- and downstream bandwidth, ping times, and information about DNS tampering.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The concept of "zero-rating" is inherently biased as it is not determined by the customer paying for the service. If the consumer has paid for Internet services they should receive full access and be able to choose what websites they wish to browse on their own.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Allowing specialized services means that only those with the most money will be allowed to have their content shown. This undermines the very concept of free and open exchange of ideas.

Is there a demand for specialised services? Which services should be allowed this special treatment?

The only demand for "specialized services" are from people and corporations who already have money and wish to eliminate any possible competition by denying them the ability to market their products.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs should not be allowed to monitor the content of their consumers' traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be allowed to make any interference with their consumers' Internet connection. If the bills are paid on time then they have no right nor business to meddle with the use of their clients' connections.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should clearly provide to their clients the speed of the bandwidth available, any changes in the services that have been made, and any updates to the infrastructure that may cause interruptions in service.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

commercial practices could prevent smaller service providers from reaching their entire audience and thus preventing online business growth. not one single person, entity or group should have the power to determine what services are better.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
no

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

it all leads to the same conclusion. when ISP and Telcom companies can determine what web services get prioritized, you're taking away any chance a startup might have to grow.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of the above

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
none!!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs should not be allowed to monitor traffic for any reason, just the same as phone companies are /theoretically/ not allowed to listen in on phone calls.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A two tier Internet will evolve. The Internet is the one place where equality has been achieved so let's keep it that way.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Everything possible.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Just treat all packets the same.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. If there isn't enough capacity then more needs to be built.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Stephen Kent

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Jer Flores

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Christian Will / reformX

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

Social Services

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: more agility for the end users.

Negative: more expenses.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there isn't. It's simple a commercial trend. If we look at it hard enough, we can already guess what the next trend will be.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, what so ever

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Yes

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

None, I don't care how it's catagorized. What's important is the instant pleasure I experience.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
keine

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
keine

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, das geht überhaupt nicht.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
garnicht

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Ulrich Beltrup

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Any commercial practices which limit user’s rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Probably from MI5 MI6 and the CIA and the NS!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO unless a State emergency or threat exists or a human being's life is in danger.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Perhaps with video and that kind of online traffic.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell users the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that our Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

They should provide information on quality of services parameters in very clear language in ALL contracts. Concrete examples should be provided to help us users to understand the practical impact on our internet access service. We should have the information necessary in order to make reasonable assumptions about the quality of the service available for our particular priority of use e.g. video, gaming etc.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? By end users? NO. No specialized services should be allowed period. Everything from the guy who has just created a website by himself to a multi billion dollar corporation should have equal speed/bandwidth/opportunity. The internet is not a place for restrictions on speed, or otherwise.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive none, it will even hurt companies who think they will profit from this in the long run as it will ruin the users of the internet -- the internet will become a desolate and less "lively" and active place. Companies are making plenty of money as things are,.. this is nothing but greed and power - which lead to corruption. The internet is by the people, for the people.. it was and is created by the end user,.. If you bite the hand that literally feeds you, well..

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes there is a demand for companies to have priority speed for \$\$ -- The end user, suffers as a result -- This is literally give an inch they will take a million miles and destroy the internet. You can't let this door open.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Absolutely none/zero.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. The internet thrives on being equal, and not watched by big brother. America cried out for it's neutrality,.. and won -- I am an American aiding in the same effort for my friends in the EU!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Transparency -- insurance nothing is being logged/tracked beyond obvious cookies, etc -- That all connections are equal, including mine.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, ISP's may preferentially steer me to Websites by Pre-selecting what's available. This excludes a majority of economically disadvantaged websites.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized Services can be discriminatory by allowing a fast-lane violating principles of net neutrality. However if Citizen input to their ISP's had "equal-lanes" to be inclusive of economically disadvantaged websites giving them the same opportunities as a much bigger financial firm.

Is there a demand for specialised services? Which services should be allowed this special treatment? I'm not sure if there's a demand for specialized services so I don't know what services would be considered.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

DPI can be used judiciously without non-network neutral bandwidth shaping decisions, "phorm-like" marketing intelligence gathering unless by legal means and other spying techniques.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Zero (0%) Throttling No Prioritised Online traffic

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I have an app to test my speed but I'm always interested in improving quality of the Internet connection I have especially high traffic hours on the Internet.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Barry LeBeau

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

none

Is there a demand for specialised services? Which services should be allowed this special treatment?

all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Edwin Homeier

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein, es gibt keinen Bedarf für kommerzielle Praktiken. Diese Praktiken schränken meine Rechte als Endverbraucher ein, da sie nur eigenen kommerziellen Interessen folgen.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Sie können die Vielfalt und allenZugänglichkeit der Inhalte beeinflussen..

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein! Das wäre so,wie wenn die Post meine Briefe und Pakete lesen und durchsuchen würde..

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Garnicht!

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen

wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Annette Safer

-----  
Madame, Monsieur,

Veillez prendre en consideration cette réponse des parties prenantes en regardant les lignes directrices de la neutralité du Net BEREC.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Those kind of "commercial practices" could limit rights of any company / start-up. It limit development, innovation, and at the end free competition.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, not for the purpose of traffic management.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only for technical purposes.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this

constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Salutations,  
Nicolas

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration. I am not a citizen of any European nation, but I believe what happens in Europe affects Internet users around the Globe.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no deep packet inspection - keep access wide open

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No throttling, no prioritising of traffic, with penalties for abuses. Exceptions perhaps during peak traffic times where overloads are likely to occur. Priority should be given to more basic traffic in order to keep traffic moving freely. Any throttling or prioritising necessary should be justified to oversight agencies.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all of the above.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Not sure

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
Not sure

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
I don't really know.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
I don't really know, but interference should be kept minimal.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Speed and quality of service would be good information to have. I don't think I need anything else particularly.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Yes, Internet providers may monitor traffic and content, but they should only have very limited ability to act based on the specific content. For instance, law enforcement cannot demand this information from providers without an appropriate warrant, and people should opt-in to any sale of their data to advertisers.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? For some use cases like medicine and other critical things a fast and reliable connection is important. For these cases special connection with different cables are the right decision. The normal internet should be free of specialised services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The competition is important for the startup scene, but it should be fair. If big ISPs like Deutsche Telekom, who also offer media content like T-Entertain, would prioritise their own content, they have a better position than small start up companies.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Providers should make good offers for raw internet. Customers would pay more if they need more bandwidth. Throttling certain services is a bad idea because it divides the content creators in categories (eg. a personal produced podcast is not downloaded as fast as Netflix' videos).

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should only be allowed to sell Internet. Special restrictions like VOIP etc. should be prohibited.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, I don't want my traffic to be monitored (DPI) just because some one wants to throttle my connection.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to have a guaranteed connection speed and also the information about the maximum possible speed of my connection.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Nicole Gellineau

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Dr. Thorsten Werner

Is there a demand for specialised services? Which services should be allowed this special treatment? There could be a demand for special services, e.g. health services. But these special services must be technically separated from the Internet (may be using same technology like IP) to ensure quality. Within the Internet no specialised services (apart from normal bandwidth management) should be allowed.

Specialised services (within the Internet) would allow global players (like Deutsche Telekom or Google) to pay for their services, whereas smaller companies and startups (or persons) cannot pay for these "specialised services". This would lead to monopole-like structure. In fact this would have a great negative impact on the EU-it-market as neither in the US nor in other countries (e.g. India) such specialised services are allowed by law. Future innovation would take place outside the EU and the Internet in the EU will become a closed place.

There is no real demand for zero-rating at all. It discriminates the end-user in all ways as you do not have a real choice for a specific type of service (you are forced to select the zero-rated one). Currently on the mobile market you can see many of those zero-rated music streaming services e.g. Spotify with T-mobile and Napster with Aldi Talk. If you have such a contract you will hardly choose a music streaming service other than the one provided with zero-rating. But this can be driven further to video-streaming, news etc.

Deep packet inspection (DPI) and similar techniques should not be allowed to manage the internet traffic. In times of highly usage of encrypted connection this is not useful at all and it may discriminate certain types of online traffic (e.g. VoIP or P2P). Traffic management without DPI should be sufficient for any ISP if its infrastructure is up to date.

Normally the ISP should not interfere with my Internet connection at all. In case of temporarily limited bandwidth the ISP should be allowed to prioritise certain types of online traffic (e.g. VoIP) to ensure the functionality of these types. Such intervention should be monitored by legal entities to ensure that these are used only limited and to ensure that the ISP is investing in its infrastructure to overcome such situations.

As speed is the mainly advertised data for internet connections, this would be my main interest. The I want to have information of the speed which is guaranteed for the connection (default speed) and not the speed which is the maximum for the technology (as currently mainly advertised), e.g. Advertisement with up to 16 MBit/s but connection is only at 4 MBit/s. In any case I want all information about traffic management in case certain types of online traffic are throttled or prioritised, this is also valid if certain special services are prioritised.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would slow and prohibit innovation as it would reduce incentive to produce new material.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Never.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Get ALL the information!

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It is not good to restrict the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All information

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? Specialised service is any service provided over the Internet access connection that is given additional quality by the Internet access company. Under the Regulation, this optimisation must be objectively necessary for the electronic service being accessed and not simply granting priority to the service. The access provider must also ensure that there is enough capacity so that the quality Internet access is not undermined. The necessity should be verified by the national telecommunications regulatory authority.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, auf keinen Fall. Meine Daten gehören nur mir.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht. Gleiches Recht für Alle!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Eva Beadling

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
none

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
NONE!!!!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all should be available.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Madeline Shaw

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No. Yes, because my internet speed would be penalised.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There would be no positive impact. The negative impact would be that the internet would be less equal and would discriminate against those with less income.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should be easy to compare by being transparent and using the same terminology as each other. They should all give the maximum and minimum speed connection in a straightforward way and set out the practical consequences of using VoIP applications to give a clear picture of the quality of service available.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

GAR NICHT !!!!!!!!!!!

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
brd

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Peter Goldberger

Is there a demand for specialised services? Which services should be allowed this special treatment? Perhaps there is from those who want to make financial profit (by offering higher speeds and thus more content). Which should be allowed? None, because, to give an example, emergency services should use the phone (which is more immediate and generally provides a safer connection).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I cannot really tell, but the internet has so far, to the relief of many, been an instrument which guaranteed a certain degree of equality amongst its users.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Is there a demand? There seems to be. But in this world nothing comes gratis. So what little transparency there is left in the net may well be impaired by exploiting the customer through new (but hidden) economic models.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, not really.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Not at all, if possible.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All that information which helps to promote transparency - even to the degree that I might see how secret services and the like interfere with my use of the internet.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Services used in emergencies related to health, disasters and to prevent injuries or deaths.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No. That's a breach, an invasion in my privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
The connection must be free to use when needed and it doesn't matter what's the channel is being used.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
The sentence is true. More is better.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Technically there is a case for traffic segregation. This does NOT infer fast & slow lanes.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
The internet will end up in the hands of the corporates; If you're worried about the dark web now just wait until that happens...

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, not with end users

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
0% It shouldn't

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Full information - it's my day job

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. While some ISPs use this to manage the traffic for the end user, most use it to prioritise their own preferred products.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, there is NO demand for "zero rating" except from ISPs in order to suck more money out of a regulated system.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

When the Internet is throttled, innovation stalls.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand for specialised services except in the eyes of ISPs in order to make people pay more for access.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. They do not need to know what the contents of packets are to manage traffic. Do the police inspect the contents of cars on the road to manage traffic? Of course they don't.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should never be allowed to interfere with an Internet connection. Do I pay more to phone my Granny than to call Microsoft? Of course not.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Everything.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
High Flight Arts and Letters

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Never!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
ISP should tell customers how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

ISPs must be treated as 'common carriers,' like bus lines; there must be no restriction on content unless the content can be proven to be malicious and damaging to the internet system -- such as 'worm' viruses or other material designed to reduce the functionality of the system or customers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

This 'new' system, like the previous telephone and telegraph systems, must not be limited by prohibitions on innovation in hardware or software. As long as the innovation cannot be proven to be destructive, it must be allowed. A message that 'locks' a user to a particular service would be considered 'malicious,' in that it limits the customer(s) to a single connection.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, as long as the traffic does not create system blockages. 'Sabotage' (malicious content) is the one excuse allowed to restrict service to an individual account.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The only reason an ISP could use for restricting service to an individual customer is proven malicious behavior by the customer. 'Blanket' restrictions must be prohibited.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Any and all 'restrictions' must be explained in full detail by the implementing agency. As long as the traffic item does not damage the network or cause perceptible harm to the recipient(s), it must be allowed. 'Political damage' is an illegitimate term.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialized services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Richard Scherzer

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Eine Überwachung der Inhalte des Datenverkehrs durch den Provider muss verboten sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann

nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Dirko-Joachim Gütschow

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No they should not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISP should not be able to interfere with my connection. They have no place or right to do so and they should not be allowed the right.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Bethany Sutcliffe

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No demand for such services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, I want freedom

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Rich can buy fast lanes and influence the people

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
online allow it for voice over ip

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All the Points mentioned above

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Dr. Steffen Skatulla

no, none

fast connections only for big companies, slow for individuals, small companies and start ups

no, promotes some big existing services, hinders emerging new services

no, all traffic should be handled equally, the best would be end-to-end encrypted traffic, content is for the eyes of sender and reciever only!!!

instead of prioritising traffic isps should make an effort to build faster connections for every type of traffic

none, i can measure my speed and latency on my owne

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The sad fact is that anything that creeps towards conglomerate formation and reduces net neutrality is not a great thing...it goes against the spirit of what the net was set up for, in the first place. As long as human lives aren't in danger, zero-rating is one of those very gray areas that's best avoided, if at all possible, to keep everything fair.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see specialized services as something akin to forming monopolies...if you are talking about specialized services to help sustainable efforts (food, water, medicine, etc.) in developing countries, maybe that's a good thing...if you are talking about a company/conglomerate using specialized services to 'GROW' its consumer base of products, then I am very uneasy with that...again, this could go into many shades of gray...tricky stuff!

Is there a demand for specialised services? Which services should be allowed this special treatment?

I have no idea if there is a demand for specialized services, or not...I use the computer as a tool, soley...not away of life. But, I have a lot of friends and family who are the opposite...if you go by their general reaction, they don't wish for ANYTHING to interfere with net neutrality. If you go by trying to help developing countries with certain specialized services, then--again--that may be positive. On this, I am not the best customer to consult, I admit.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know more about how the traffic area of our Charter internet service is conducted...I'm not just talking about slow-downs, or stalls, due to malware...I'm talking about the service, as a whole, to all consumers...I'd like to see some graphs about the traffic of private citizens--like myself--as compared to companies (small, or large)/conglomerates, etc. Thank you.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I'm still undecided about the topic, but for the most part, private passages should be kept private...just like hardcopy letters, etc. Have a suspect that may have committed murder/assault/terrorism, etc.? Then, get a warrant, just like police would for any other evidence and go to it...it's unfortunate if the individual in question turns out to be innocent, and private facts get aired to the police, that would have otherwise remained private, but until all police become top psychic mediums, you are going to have to give law enforcement more to go on, to solve serious crimes than a few crumbs...

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Now, here, my answer is: none at all; just because I "have" access to the Mars, Inc., candy empire does not give me the right to quash where they send their goods...or at what speed/frequency, etc.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Only a court order should warrant that kind of privacy invasion.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None! I pay for my fast internet, so it should always be fast, no matter what my activity is online.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Daniel

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Marcus Zottl

Is there a demand for specialised services? Which services should be allowed this special treatment? This should only be possible for things like medical services (tele operations) and similarly critical services that serve the general public.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! Just like mail delivery companies (postal service) should not inspect (and read) "classic" mail, ISPs should not monitor and inspect traffic on the internet!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

None at all!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

"Specialised" services help the big players to monopolise the online influence and the online market. Needless to say this is not good for a democratic information system.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No "special" service is needed if their purpose is to narrow the information channels of competitors.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Transparent information, easily understandable should be provided by every ISP for their customers. Statements about transmission performance should reflect the average (not the maximum possible) rate. All media (music, video etc.) should be accessible without discriminatory policies.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating is a covert means of discriminating between internet traffic and represents censorship by commercial means

Is there a demand for specialised services? Which services should be allowed this special treatment? There may be instances when specialised services are necessary but these should be carefully restricted else to contradict the aim of net neutrality

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services is another means by which to discriminate between and censor internet traffic and is contrary to the principle of net neutrality

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would want all information disclosed in relation to speed and quality and, in relation to traffic management, all relevant information in order for me to ensure that net neutrality was being complied with.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to discriminate internet traffic

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This information is private.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand from users for "commercial practices" such as zero rating. Zero rating encourages users to use the content that does not contribute to their monthly download limits.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. I do not wish to be spied upon.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to interfere with my Internet connection at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There exists no demand for commercial practices.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No demand for specialized services

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference whatsoever

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All the above

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Stephen Zettel

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

This could negatively affect everyone's internet access.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Any and all. Open transparency.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Bei den sogenannten Spezialdiensten geht es den Providern doch nur darum max. Profit zu erzielen. Natürlich geht das Ganze zu Lasten der "Normalverbraucher".

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Selbstverständlich nicht! Wenn ich einen Brief schreibe, möchte ich ja auch nicht das der Postbote ihn liest!

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Friedhelm Old

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Unsure

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Yes

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
John Panko

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Jan Karres, Germany

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I see no demand for commercial practices as it would discriminate and censor online activity.

Commercial practices would limit my right as an end-user and my freedom to access information. As a graduate student and future librarian commercial practices would limit the intellectual freedom of all end users and would commodify information that belongs in the public domain.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand for specialized services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I cannot see any positive impacts of specialized services because nothing good can come from charging for the internet. The cost of internet service already prevents millions of people from accessing the internet and has created a digital divide for people of lower socio-economic means. It should be a human right to access knowledge and the internet is the ultimate way to access knowledge. Open access to knowledge creates innovation. Innovation means the resolution to problems and the advancement of society.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

average available speed in easy to understand language, their speed of connection in easy to understand language, and quality of services in an easy to understand language.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no interference with internet connection.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Kimberly Martin/Emporia State University

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not from me. Yes. Creates situations where people can't communicate freely.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: None for the individual end-users.

Negative: Makes it possible to drive the end-user towards certain information while obscuring other. Opens a window for manipulation (political and otherwise).

Is there a demand for specialised services? Which services should be allowed this special treatment?

None from me. None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would certainly like to receive honest information on how my traffic is managed (i.e. if there is someone snooping on it, or if some services are offered preferential treatment).

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I would like to know speed (the advertised speed is often far more than the actual speed, in my experience), and how my traffic is managed.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you

should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

mit freundlichen Grüßen,  
Konrad BARKE

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

why are you trying so hard to fuck up the internet? is it really to stop the little man from uniting across the globe?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

all these questions are bullshit, you know exactly the impact you're aiming for by screwing us over yet again.

Is there a demand for specialised services? Which services should be allowed this special treatment? hand over all power of decision making in regards to the internet to the 99% and watch it flourish.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
absolutely NOT

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
no interfering at all, we already pay for speed and/or data caps. A lot of times we don't even get what we pay for. So you want to kick us in the teeth some more?

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all of the information, thank you!

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
tom henke

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Ole Jungclaussen

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Ole Jungclaussen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Not that I'm aware of.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
ISPs have no business monitoring the content of traffic, for any reason.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Throttling should not be allowed and prioritized traffic should be banned, lest ordinary consumers suffer horribly. The Internet will become a "pay to play" commodity.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
ISPs should provide information on quality of services parameters in very clear language in all contracts.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It affects my rights to choose. Only an equal display of opportunities leaves the choice on my side and thus respects my rights as an individual and human being.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Future innovation will be inhibited by favouring certain services over others. Possibilities will be diminished

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not at all. Also it doesn't even help to forecast or plan. It is a delusion of false logic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. Leave it to unforeseeable effects of emergence.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Jannik Beyerstedt

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

Generally I don't think, that there is a demand for specialized services. Especially the car to car communication example is nonsense, because car2car is done local, over small distances, which has no need for specialized services.

And about e-health: If necessary, you can buy a fixed connection with assured bandwidth, which does not discriminate the general traffic.

So there are no specialized services needed, especially at these publicly discussed topics.

\*What could be the positive and negative impacts of specialized services on future innovation and openness of the Internet?\*

I think, that the internet should stay as it was invented - as a network of interconnected networks with no traffic discrimination. If there is enough bandwidth (which is given currently in the backbone) there is no need for anything else than free (not in the meaning of free of charge, but as libre/ frei) internet.

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

I think, that zero rating is against a free distribution of information. This limits a group of people, often people with not so much money to spend, from accessing unfiltered information. This is bad in many ways.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

Deep packet inspection is a very bad habit and the ISP should be a pure service provider, who is transferring data, not inspecting it. An ISP should be compared to the postal system, which also is not allowed to read your messages.

Another thing is, that deep packet inspection is useless, if you use (HTTPS) encrypted connections, which should be standard. So where is the point? Deep packet inspection is useless and invasive in any way.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

In times, where the separated analog and digital (ISDN) telephone communication is being turned off and replaced by VoIP services, there is a certain demand for a reserved bandwidth for telephone communications. But this is only the case on the last line to your house! Not all the internet connection on the ISP side! There is no need to interfere with certain types of traffic. And the problem on the last connection to your house is only present, because of small bandwidth (especially in Germany).

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I would like to have information about the uplink and downlink speed and whether anything is done with my traffic other than passing it to the requested IP-Address / the backbone.

In particular I would like to know:

- whether some types of traffic are throttled or prioritized
- whether my connection has an public IPv4 address or is hidden behind a carrier NAT
- whether my connection has a static or dynamic IPv6 address / address range and whether the IPv6 address range is given by DHCP or similar technology or if I can choose the address on my own.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have no desire to be exposed to these services and believe they would limit my rights e.g. by effectively reducing competition in video streaming services to large companies which can afford to pay premiums for artificially faster internet connections.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Small companies, where much true innovation happens, will be unable to afford, or unfairly and destructively hampered by, these charges for artificially faster internet connections.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None at all. Net neutrality is a fundamental design principal of the infrastructure and protocols which define the internet, without those ideals the internet would not have seen the enormous growth which benefits so many people today.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Complete transparency on all expected values, expected variance in those values, and all policies and conditions which affect expected speed and latency in a connection.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-Rating fördert den Einfluss von Google, Facebook & Co. und sollte nicht angewandt werden

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Der kleine User bleibt auf der Strecke

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Medizinische und sicherheitsrelevante Dienste, wie z.B. die Online-Steuerung von kommunalen, technischen Einrichtungen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Überhaupt nicht, alle sollen gleich behandelt werden.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Möglichst alle

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Harald Rücker, BI lebenswertes Korbach e.V.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Krzysztof Woźniak

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

No, the only exception can be some "emergency lines". For example in mobile network calling 112/911/etc. could have high priority because that is critical for someone's life.

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

It is simply demanded by wealthy corporations to earn more money. It is wrong for the people.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No, it is against the human right, the right for the privacy.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

Absolutely none for the commercial stuff. However to the life critical service (like calling 112/911) it may be allowed to even stop the whole other bandwidth.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I think there are 2 most important indicators: minimum bandwidth (avg. and max. are not important) and minimum guaranteed availability (e.g. down time cannot exceed 1 hour per month).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-

discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for commercial practices of such as "zero-rating," beyond those made by ISPs for personal, financial gain. What I do on the internet, whether that is researching and applying to jobs, watching Netflix, playing video games with a friend across the world, or just reading and editing Wikipedia, is NONE of the ISPs' business. The ISPs' priorities are not necessarily the same as MY priorities, and allowing them to privilege one kind of traffic over another denies me the right to my own choices, and unduly influences choices I may make on the internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely NOT. There is no acceptable reason for ISPs to have access to that information.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE. ISPs creating arbitrary restrictions creates financial benefits for the ISPs, and detriments for internet users (who are forced to pay an arbitrary price for "faster" (aka non-throttled) internet access). Were ISPs allowed to infer with users' internet connections, they deliberately create a system in which internet access is a privilege, not a right. With internet access becoming more and more necessary to everyone, across the globe, in every financial bracket, of every class and color, this artificial barrier is an offense against humanity -- particularly those less privileged, less wealthy, and most in need of that access.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

If I look at my phone bill, I can see my usage: the number of texts I've sent, the time I've spent on calls at night or during the day. I can see how much data I've sent and received. If I look at my phone itself, I can see how strong the signal is, and what network my data exchange is being processed on - - i.e., how quickly or slowly my data will be processed, and how good or bad my cell phone service is. We've had these standards for years. They're a basic expectation. Why should we treat the internet any differently? It's more than reasonable to expect the same or better from ISPs. The internet is a utility; when was the last time you met someone without the need and/or access to the internet? Some people go to the library (some used to go to payphones), some people have computers at home (some people had party lines, then personal phone lines), some people only have access through their phones (some people carry tiny computers around in their pockets, which also work as phones). Internet access is pervasive and necessary; everyone across the world is entitled to know all of the information available about their internet connection.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Sehe keinen Bedarf. Möchte gerne Datenpakete zu vernünftigen Preisen, damit ich mir die Inhalte selbstbestimmt aussuchen kann.

Ferner könnte ich gezwungen sein, bestimmte Anwendungen zu nutzen, auch wenn mir diese nicht zusagen, weil mein Provider Konkurrenzprodukte blockt.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Das einzig positive, das mir einfällt, könnten Dienste der Katastrophenhilfe sein. Dass ich schneller an solche Informationen gelange wäre als Betroffene(r) sicher von Vorteil.

Bezahlte Überholspuren im Allgemeinen sehe ich jedoch als monopolistisches Mittel der 'Big Player' um ihre Marktmacht zu stärken.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Wie bereits erwähnt, Katastrophenhilfe und ähnliche soziale Projekte.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Verfügbarkeit. Stehe meist vor der Box, alle Lampen grün und doch keine Verbindung nach draußen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein, nachher werden meine Pakete geblockt oder extra langsam geroutet, weil meine Anfragen dem Provider nicht passen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht. Es sollte mir mit (der vom Provider bereitgestellten) Hardware überlassen sein zu entscheiden, welche Dienste ich bevorzugt behandeln möchte.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen.

Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Axel Yoshimoto

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

This is breach of privacy and should not be allowed for a truly free and open internet.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference should be allowed.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for commercial practices from individual, private Internet users. These are imposed by existing groups that are a means of funneling traffic towards their own content which in turn severely limits what is available from smaller users. It should be up to individuals to decide which content they can access.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services paves the way for discrimination towards Internet users seeking to remain independent of large corporate entities. Regulation of specialized services would be the end of free Internet access and economic competition due to the creation of "fast lanes" by major players. The only positives to this regulation would be for whoever is running the fast lanes as they would be increasing their own profitability while outcompeting smaller entities.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. This is a violation of my privacy and personal freedom.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no interference at all. It goes against my wishes as a consumer and this is alarmingly close to censorship.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Gibt es einen Bedarf für "kommerzielle Praktiken"?

Für den Provider höchstwahrscheinlich- JA. für den Endverbraucher eindeutig - NEIN

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Jeder "Spezialdienst" ist eine Möglichkeit in die Neutralität des Netzes einzugreifen. Das lehne ich ab!

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?

Gibt es einen Bedarf für Spezialdienste? Nein!

Die erforderliche/gewünschte Bandbreite hat der Provider bereitzustellen. Dafür bezahle ich meinen Provider.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein, das geht den Provider nichts an.

Wenn ich die Autobahn befahre muss ich auch nicht angeben wo ich hin will.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können.

Überhaupt nicht. Er soll die bestellte Bandbreite liefern, nicht mehr und nicht weniger

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist.

Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen.

Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen

würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
none

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
I do not know.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
I have none.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
all of this information

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open,

best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Jonas Steponaitis

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No services should be allowed a special treatment / priority.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Absolutely no. Under no circumstances.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference whatsoever. The Internet should be free and open, and up to each individual.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

To be truthful, I don't know.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

ISPs and governments would have more control over what we see and hear. I'll decide what's appropriate for me to see and hear.

Is there a demand for specialised services? Which services should be allowed this special treatment? I would need to see examples of specialized services before making a decision.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Efficiency and expediency are not sufficient reasons to take away any portion of a person's privacy rights.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None. I'll decide what's appropriate for me to see, not an ISP, and not the government.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Whatever is necessary for my benefit.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Es wird geförderte internetriesen geben mit denen keine noch so gute Idee mehr konkurrieren kann.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein bzw keine.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, mein Surfverhalten ist teil meiner Privatsphäre und sollte in diesem Sinne nicht beeinflusst werden. Analysen von mir aus, aber eingreifen NIEMALS!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Wenn mir jemans erklären kann was das bringen soll kann ich es mir überlegen.. bis dahin finde ich es eine unverschämtheit!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Qualität und Geschwindigkeit sowie Datenmenge und gespeicherte Daten von mir möchte ich im Überblick haben.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Justus Otte

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't care if there is demand or not. The internet should be considered infrastructure, like radio, TV. Regulation should not stifle competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It violates the entire principle of what the internet ought to be, which is to be open to all users.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Don't know. Not by me.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. I don't want anybody opening my mail, either, or tapping my phone or government voyeurs peeking through my windows. Leave us alone!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None, zero, zip, nada

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Just want it to work

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Dario Cuzzilla

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

never

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,

David McFarland

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Rights of access will be limited to those who are willing to pay extra over this who are unable to.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: Companies will make more profit.

Negative: End users will suffer.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

This information should be available on demand. Users have the right to use their internet access freely and request traffic shaping to be switched off when desired.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Quite simply, no. Let's try getting those with little/no internet access up to speed before meddling with those who currently already have it.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The internet is an open network, it's not actually owned by anyone. With this in mind why are companies trying to monetise what in essence is a free platform? Traffic shaping will just disrupt those who already use the network in their own legitimate way.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No and None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Could give the ability to censor sites, control data speeds and log even more data against my ip address.

I for one am about to start using more encryption and a VPN

What could be the positive and negative impacts of specialized services on future innovation and openness of the Internet?

Promotion of big business over smaller ones, Thus gain more ground and shutting others out.

Censorship and restrictions on what was always meant to be a free place for all to use and enjoy

Is there a demand for specialised services? Which services should be allowed this special treatment?

No there isn't and none should be allowed any special treatment

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All relevant information regarding my paid access to the net should be disclosed to me

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Höchstens Ärzte die eine absolut stabile Leitung benötigen z.B. Tele-Operationen. Ob dies aber wirklich über das Internet laufen muss ist die andere Frage. Trotzdem kann in diesem Fall eine Ausnahme gemacht werden, da dies nun mal wichtiger ist als dass jemand ein Video abrufen kann.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Natürlich wäre es gut wenn man beispielsweise ein Video-on-demand Angebot hat wenn dieses auch stabil läuft. Trotzdem habe ich lieber stockende oder Videos mit niedriger Qualität als dass dies das Ende des Internets wie wir es kennen darstellen.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Möglicherweise, allerdings wäre dies Kartellrechtlich sehr bedenklich und würde vor allem Start-ups behindern. Keine wirklich gute Idee.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Gar nicht. Das Internet soll Dinge gleich behandeln. Es kann in Notfällen Ausnahmen geben, diese müssen aber begründet sein, diese Begründung sollte nur zeitlich begrenzt gehen und muss gut begründet sein, Begründung muss öffentlich sofort, spätestens aber innerhalb 2 Wochen erfolgen. Und selbst dann sollte die Geschwindigkeitsunterschied nicht mehr als 25% des Traffics betragen.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Ich hätte gerne Informationen darüber, sehr gerne. Vor allem aber ein besserer Service wäre hier gut. Transparenz und Kommunikation darüber wie die Geschwindigkeit an meinem Standort ist wäre sinnvoll. Es sollte beides vorhanden sein: Maximalgeschwindigkeit und Durchschnittsgeschwindigkeit.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolut nicht. Deep Packet Inspection ist wie das Brechen des Postgeheimnisses; dies muss gleich behandelt werden wie wenn jemand gegen das Postgeheimnis verstößt!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Regulation explicitly bans commercial practices that limit the exercise of individual users' rights online. Zero rating (where access to some applications/services is unlimited while all others are counted towards your monthly download limit) allows the provider to discriminate between online services. Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Commercial practices in the Regulation should be understood as any restriction on the basic functionality of the Internet for commercial purposes and which is not necessary for the functioning of the network.

Paid content services (subscription to music or video services) are different from zero rated services, as access to the entire internet remains uncompromised at all times.

Any commercial practices which limit user's rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Ed Green

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Ainsley Skye Waters

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Jan Huwald

In case of media shared by independent persons (e.g. cable modems) it is in theory ok if multiple tiers of traffic are available, e.g. bulk and low-latency. But this depends on several hard-to-meet precodintions:

1. Traffic classes have to be independent of the protocol, service and packet destination.
2. Preventing starvation of one traffic class due to high demand of another is mandatory.
3. Classyfing to which traffic tier a packet belongs has to happen under full user control. This is manageable for the upstream (to ISP) but not yet developed for downstream applications (from ISP). A possible implementation would allow the customer to setup firewall-like rules (e.g. udp port 65 -> low latency; otherwise -> bulk).

Given that the internet works quite well without special treatment and that regulating this special treatment is highly complex it is advisable not to allow to all.

A proliferation of special-services will be an additional factor that prevents the modernization of internet protocols, as novel protocols will typically be unable to use special services.

There is no consumer demand for zero rating at all. Zero rating works against the universal right of every human being to have an internet connection. Instead disadvantaged people will be economically forced to use the zero-rated connection and thus become victim of aggressive advertisement, surveillance and access limitations. By claiming that the poor already have "internet", the motivation to get them actual internet access is reduced.

Per default an ISP should look into no layer above the IP layer.

If the user wishes to enact some traffic management at the ISP (e.g. downstream traffic shaping as discussed three questions ago) then an ISP may look into higher layers, but only to the explicit instructions of the user.

In the absence of resource contention the ISP must not interfere at all.

In the presence of contention, the ISP may interfere. It must not prioritize based on protocol, service or destination. It may prioritize based on long-running bandwidth averages with the end result that a user with spiky traffic pattern (e.g. HTTP surfing & downloads) gets roughly the same bandwidth share as a user with constant bandwidth (e.g. P2P filesharing).

1. Bandwith from me to the ISP and from the ISP to the rest of the internet.
2. Amount of contention (e.g. the percentage of a month where demand exceeds available bandwidth)
3. Availability
4. Number of assigned IP addresses, size of IPv6 subnet, policy how the

addresses are recycled (e.g. static IP vs. random IP) 5. Statement that no discrimination of traffic based on protocol, service or destination is happening.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No zero rating! I want to be free to use all Internet services, without someone manipulating my choices. I don't want my use of the Internet to become complicated by being presented with hazy and misleading "facts."

Is there a demand for specialised services? Which services should be allowed this special treatment? I am perfectly happy with what I currently have access to. Again, there's no need to complicate and interfere with my free use of the Internet. I don't want to have my online experience disrupted by redundant and unnecessary controls.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! I want a free internet, not one that routinely compromises my privacy for their own very questionable reasons.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Clearly stated information--not information written in language that is difficult for the average person to understand. People differ in the information that they seek about their service. I believe all the basic information that relatively computer savvy users need in order to get the optimal use of the Internet should be available.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Absolutely. It's a terrible idea and interferes with our rights to interact with other people.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Honestly I don't see any positive impacts of losing net neutrality for the average user and customer base. At all. Big business DOES NOT have more rights than the people.

Is there a demand for specialised services? Which services should be allowed this special treatment? The amount of money and time going into this would be incredibly detrimental to everyone and would end up a loss making revenue.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Absolutely not. This interferes with what people can see, and as such, free speech.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Any/all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any "demand" for such commercial practices, such as zero-rating, would be driven by ISPs searching for greater revenues and greater control over the internet. No such practices should be permitted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialized services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? As I stated earlier, demand for such "specialized services" would be driven by ISPs seeking to maximize their profits and control of the internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No interference should be permitted

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

My ISP provider furnishes me no information regarding my service. I believe all ISPs should provide clear, understandable and easily available information about its service? BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. All ISPs should provide concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialized services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behavior in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
very dismal...

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
big telecom monopolies and restrictions on the internet are the communism in a free society, in a free internet world...

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO under no pretense or circumstances....

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
how my traffic is managed

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
none whatsoever.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Larry Podsobinski

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? The only "demand" for such specialized services comes from the greed of the ISPs who stand to make untold amounts of money by blackmailing the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
There would be NO positive impacts.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no user end demand for such practices. Such practices slant the playing field in favor of big companies that can pay the extortion "fees" that ISPs would charge. I, and many of my friends, use the internet to make a living. We in no way could afford to compete with sites like Amazon to pay to keep our sites in the fast lane that ISPs would create. Allowing ISPs to create an internet fast lane would literally interfere with our ability to pay our bills, put food on the table, and keep a roof over our heads. For us this isn't some abstract thing like "not being able to browse some of our favorite niche websites because they load too slowly". This directly effects our ability to live.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. What I, or anyone accessing the internet, do online is nobody's business but mine.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only demand comes from very large network providers. Their rating system could bury useful websites and Apps if they competed with any company or person that 'pays' into this zero rating.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Pay to play favors only the well financed content providers.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
See previous answer.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.

Desde luego que sí. Hace unos años mi operador decidió que no me cobraría por los datos de Facebook. Esa decisión hizo que mucha gente pasara más tiempo en Facebook comparativamente que en otras webs. Pero si decides no pasar en Facebook más que unos minutos al día, y lo que quieres es poder acceder a otro tipo de páginas. Orange no te lo permite, lo que constituye un agravio comparativo, puesto que yo quiero pagar por un acceso a internet libre, no que la operadora decida por mi lo que voy a ver en la red.

¿Cuáles pueden ser los impactos positivos y negativos de los servicios específicos en el futuro de la innovación y la apertura de Internet?

Voy a poner un ejemplo que está en mente de todos. Movistar ha conseguido en España agrupar casi toda la oferta de series y fútbol. Ahora aterriza Netflix y la compañía decide que Netflix va a ir más lento en las conexiones de sus usuarios. Eso machacaría a Netflix en favor de Movistar, ya que los usuarios preferirán no tener que esperar para ver series en streaming. Ahora bien, Netflix es una compañía establecida y con presencia en varios países. ¿Qué pasaría si en lugar de Netflix le pasara al servicio de una startup? Pues que seguro que eso los hundiría y con ellos cualquier posibilidad de innovación. Estamos hablando de algo muy peligroso que es mejor que nunca tengamos que ver hecho realidad,

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

A mi juicio, existe una demanda de un acceso libre a internet en el que no se discrimine ningún servicio. Por ello no se debe dar ningún tratamiento especial a nadie. Sobre todo cuando el motivo no es ventajoso para nadie más que las propias operadoras que buscan incrementar sus beneficios de formas que deberían ser ilegales.

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

No. Las operadoras o ISP son meros canales en los cuales los usuarios compramos nuestra conexión. Como consumidores queremos lo que pagamos y no podemos tolerar que se monitoricen nuestras comunicaciones, ni que estos puedan negociar con las grandes empresas de Internet para recibir pagos por otra parte. El negocio es el que es y debería ser ilegal cualquier intento de extensión en las direcciones mencionadas.

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

Nunca. Como ya he dicho, yo pago por la conexión y eso es lo que quiero obtener a cambio. No es justo que puedan vendernos para agrandar sus beneficios.

¿Qué información te gustaría recibir respecto a tu conexión a Internet, por ejemplo sobre la velocidad, calidad de servicio o cómo se gestiona el tráfico?

No deseo recibir ninguna información. Lo que quiero es una Internet libre y abierta, sin injerencias de ningún tipo ya sea en monitorización o gestión del tráfico. Bajo ningún concepto el tráfico debe ser gestionado. Como los ríos, que fluya libremente y sin cortapisas. Si de verdad en Europa lo principal son los ciudadanos, no existe motivo para regular Internet, ya sea el zero rating o lo que sea. A no ser que lo que prime en Europa sea solo el dinero y las grandes empresas. Si se les debe permitir estrujarnos como mejor les parezca, entonces adelante con este absurdo. Pensemos una cosa más: si la conexión es un servicio por el que pagamos los usuarios, ¿por qué buscan sobrarles a los que ponen los contenidos? Se debe cobrar a unos o a otros, pero no a los dos. Se debería avanzar en que la conexión a Internet sea un derecho para el ciudadano y que sea como tal gratuita. Para ello, los estados deberían renacionalizar las operadoras. Todo avance en sentido contrario a esto, es un sinsentido.

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de

mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No throttling of any kind.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for commercial practices. As already said - provide fast internet in general. Otherwise it will be hard for startups and little services while big companies become even more untouchable. This will be counterproductive to innovation.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can not see any positive aspects beside in very special areas of e.g. real-time applications for science and health. Negative impacts are obvious: It is bad for all services which are not well-known, it is bad for every company with lower budget and it is bad for every internet user which is performing unconventional activities.

Is there a demand for specialised services? Which services should be allowed this special treatment? Not really. As already said - if even - very special cases which are important for humanity in general e.g. health and science.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much information as possible but in a clear, structured, understandable way. A consistent, strong internet connection with no lags is more important than speed alone.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not. Surveillance by the ISP for the purpose of traffic management is a no go. This information may be misused. The traffic management is undecidable in a fair way.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not in any way. Provide fast internet generally everything else will lead to inconsistencies and unfair treatment.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Just stay out of the internet. Stop trying to control and interfere and spy.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Then the internet just becomes another tool of the corporate takeover of the US and the world. This needs to stop. This is insane. Stay out of it. Mind your own business and stay out of mine.

Is there a demand for specialised services? Which services should be allowed this special treatment? Companies that need it for video streaming like a Netflix.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. That is spying. Government has no business in my business.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. Stay out of it. You have not business interfering.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I've tested my internet speed many times. I'm told by Time Warner Cable I'm paying for 50 but when I test it it goes as low as .14 and the highest I've ever gotten is around 23. There are no other services available to me and I live in NYC. This is more corporate bullshit and control. I pay a huge fee every month for this fraudulent service. This is more corporate control. Where is my freedom of choice? There is none.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Julia Dalton

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? If services are allowed special treatment, even if such special treatment costs no money to enable, it puts unfair strain on Web service companies who would need to seek out these options and spend money to research the consequences of using them, risking loss of users in either case

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services restrict the rights of users by allowing ISPs to freely influence the actions of the user. It can easily coerce users into sticking to "approved" platforms for discussion and away from new businesses and small communities

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I do not like this practice. As a T-Mobile customer, my phone traffic is currently subject to such zero-ratings and it does certainly influence which websites I choose to use and puts new services at a disadvantage

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Certain protocols can be throttled, but only in times of heavy load to support essential infrastructure. In the case of checking for video traffic, P2P or other types of traffic, ISPs should only be able to look at the network protocol and not throttle based on destination or source addresses

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, they should be required to obtain a warrant for each instance of packet analysis, as it is akin to rifling through a person's home and analysing their personal things.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

If I am paying my ISP for a certain level of reliability and speed I should be able to check the actual performance through their website as measured from their connection to my modem. This includes minimum speeds, maximum speeds, ping, downtime, averages, and comparison to advertised results.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Keine kommerziellen Praktiken - kein Zero-Rating Ich vermute ein Großteil des Datenvolumens auf Servern und auch der Datentransfer dient lediglich kommerziellen Praktiken. Untersuchen Sie doch mal die Auswirkungen von personalisierter Werbung und den großen Datensammlern auf unser Klima. Das Internet sollte der Menschheit dienen und sie weder kontrollierbar machen noch mit unnützer Werbung zumüllen.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Es liegt doch auf der Hand das solche Spezialdienste dann zum Steckenpferd der Telekommunikations-Konzerne mutieren. Dort wo Geld zu verdienen ist wird investiert, Service geboten und hofiert.

Der Privatanutzer ist dann doch keinesfalls mehr von Interesse für einen multinationalen Konzern.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Wenn überhaupt vielleicht Rettungsdienste, Infrastruktur, etc. aber keine kommerziellen Dienste

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Meine Privatsphäre sollte meine Privatsphäre bleiben und nicht verarbeitet werden wozu auch immer.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte nur einen schnellen, zuverlässigen Zugang.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Lutz Koch / Der Lutz

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ein solcher "Bedarf" darf die Freiheit des Internets nicht einschränken und die Gleichberechtigung der Nutzer nicht unterlaufen

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Nutzerhierarchie, Manipulation, wenigstens indirekte Zensur, Angriff auf Freiheit des Internets

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine Sonderstellung, Kapazitätsprobleme nur durchaus praktikable technische Lösungen beseitigen

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht. Das technische Potential soll ausgebaut werden, um Belastungen anonym abfedern zu können

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

im Kern die genannten. Darüber hinaus Informationen über Zusammenarbeit des Anbieters mit staatlichen u/o militärischen, geheimdienstlichen Einrichtungen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Ronald Reschke

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Tobey Layne

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

0%

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know its speed, quality of service & how my traffic is managed.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Thomas McFadden

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

While there may be demand for these services, as an end user, this would be anticompetitive; small businesses can't afford to get special privileges for their content.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is an egregious breach of privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, unless there is a warrant.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Without a reasonable suspicion of illegal activity, no-one has the right to monitor internet users, their traffic or the contents of that traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no interference allowed at all. The customer has the right that - at all times, independent of the type of internet usage - he gets the full speed he or she is paying for.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user?

I say NO! What do YOU say?

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I say NO! What do YOU say?

How much should an ISP be able to interfere with the Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. What do YOU say?

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

I urge you to protect the free internet for the all of us.

Kind regards,  
Felix Betzin

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Innovative Ideen werden von Providern unterdrückt.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Es gibt keinen Bedarf.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Geschwindigkeit.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

mit freundlichen Grüßen,  
Mathias Klotz

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Only monied groups will be able to gain access. The majority of us will be locked out.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
emergency services only (fire, water, police/civil defense)

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

For me, the term Commercial Practices is too new for me to leave my opinion, so I’ve nothing to say about it, other than it sounds like it could anger a few people.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I wouldn’t know yet. I’ve just heard about specialised services, but it’s name does sound shady. It gives me the impression that the services specialize in a small specific zone, rather than one giant world.

Is there a demand for specialised services? Which services should be allowed this special treatment? None that I can think of.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

For me, Internet Speed is the most important.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The mere idea of this is just absurd through my eyes.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Personally, I’d say: None at all! Some of us watch something online on our screen on a very active basis. Interference with the internet connection would just bring frustration to people who want to watch videos or play games that can only be played online.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Leonard Melbont

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Charging more for one service than for another leaves too much room for the stifling of unflavored sites, apps and services

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

These measures would stifle competition

Is there a demand for specialised services? Which services should be allowed this special treatment?

None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above

The Regulation allows specialised services only under strict safeguards. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREK Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Nein, denn es ist ja meine Entscheidung, welche Dienste ich nutze. Wenn z.B. Netflix von einem eventuellen monatlichen Volumen ausgenommen wäre, ich aber nunmal eine kleinere, unbekanntere Streaming-Seite häufig nutze, weil sie mir besser gefällt, bessere Preise bietet o.Ä., soll ich plötzlich eingeschränkt werden? Damit entscheidet ja mein Provider für mich, welche Dienste ich intensiv nutzen darf, obwohl diese Entscheidung doch bei mir, dem Verbraucher, liegen sollte.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Zum einen könnten mittlerweile etablierte Dienste ihre Funktionen und Angebote weiter ausbauen, da sie ja über einen Spezialdienst eine ungehindert hohe Übertragungsrate gewährleistet bekommen. Das könnte vor allem fürs Streamen von Filmen, Musik, oder zukünftig sogar Games profitabel sein.

Auf der anderen Seite jedoch würde man so kleineren Anbietern und Startups viele Chancen nehmen, da die freigehaltene Kapazität für die Spezialdienste ja irgendwo eingespart werden muss, und eben diese kleineren Anbieter laufen so Gefahr, aufgrund langsamerer Übertragungsraten unterzugehen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?

Jein. Bei wem genügend Bandbreite vorhanden ist, bei dem laufen Dienste, die von dieser Maßnahme profitieren könnten, in der Regel sowieso einwandfrei. Wenn die Leitungen nun schlechter ausgebaut sind, müssen zwangsläufig andere Datenpakete gedrosselt werden, wenn zum Beispiel ein Streaming-Dienst immer die bestmögliche Übertragungsrate erhalten soll. Ich persönlich bin mir also nicht sicher, inwiefern die Realisierung solcher Spezialdienste sinnvoll/technisch möglich wäre.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein, der Provider ist eben das, ein Provider, und als solcher geht es ihn nichts an, was genau ich mit der von ihm zur Verfügung gestellten Verbindung mache.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht. Ich will generell die bestmögliche Übertragungsrate, zumal diese ja auch von den jeweils mitwirkenden Servern abhängig ist. Außerdem kann der Provider im Einzelfall doch gar nicht wissen, welche Verbindungen für mich wichtig sind, und welche nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Eigentlich möchte ich Zugriff auf alle relevanten Daten haben. Schließlich brauche ich ja etwas in der Hand, sollte es einmal zu Problemen mit der Verbindung kommen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Tom Neumann

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.

SI

¿Cuáles pueden ser los impactos positivos y negativos de los servicios específicos en el futuro de la innovación y la apertura de Internet?

Huida de los servicios de internet por miedo a la censura, al control social y la represión.

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

[cbeac7ba@opayq.com](mailto:cbeac7ba@opayq.com)

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

NO

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

NADA

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

Kind regards,  
Oscar Revilla

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

YES!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Sunshine is given to everyone. The internet needs to stay neutral.

Is there a demand for specialised services? Which services should be allowed this special treatment? All services should be treated equally.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Nothing seem to be clear for my ISP

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Nasir A Rahim

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Q. Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

A. There is no \*consumer\* demand for restrictions such as 'zero-rating'. It's a back door and twisted method which negates net neutrality.

Q. What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A. There is NO positive impact by moving away from net neutrality.

Q. Is there a demand for specialised services? Which services should be allowed this special treatment?

A. There is NO \*consumer\* demand for 'specialised' services. The name along is misleading and fraudulent. The only reason these schemes exist is to limit free access and increase corporate profits and domination over individuals.

We in the EU need a 'People Not Profits' approach to everything we do. This is why the EU isn't as popular among individuals as in the past.

Q. Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

A. Absolutely not!

Q. How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

A. There should be NO interference.

Q. What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

A. Honest, factual speed reporting.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I think that the concept of specialized services shouldn't exist from an infrastructure standpoint. It's up to the companies building on top of that architecture to build around the infrastructure.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can easily think of how it would disadvantage newcomers, especially if the telecoms get cozy with big content providers. I have a harder time thinking of the benefits.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It seems anticompetitive - content and infrastructure are two different things, and using infrastructure to advantage content doesn't make sense to me.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I don't like prioritization.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Depends on the definition of "traffic management." If they're talking about throttling one kind of traffic or another, no. If they're talking about intelligently routing one kind of traffic or another, yes.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd love to get more information than just what my connection speed to the ISP's network is. That doesn't tell me anything.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Tanner Stirrat

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No no extent!

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is NO demand among the public for zero-rating! Yes, this could limit my rights by making it hard to see what I really want because zero rating would favor only those sites that pay to be favored.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

You're unable to view whatever you want since only those that are favored will get through.

Is there a demand for specialised services? Which services should be allowed this special treatment? No, there is no such demand. No one should be favored over another.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Never!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of these.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't think so. Allowing that is like closing down already existing road lanes and charging money for people to use these lanes.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. There should be well defined standards which protocols are handled first (e.g. VoIP) and which to handle after them. No further management is needed to give everybody the same rights in the internet.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should only be concerned to keep its network up to date to allow every paying customer to consume whichever data he or she wants to.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know how the connection to other networks is realized (e.g. what bandwidth is available) and how much my internet provider earns by limiting that access for content providers.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Jérémy Bobbio / Debian, The Tor Project

> Is there a demand for specialised services? Which services should be  
> allowed this special treatment?

I don't know any services I use which would require special treatment.

While there might be a few legitimate use cases, once Internet Service Providers develop the infrastructure to offer special treatment at a large scale they are likely to extend such an infrastructure to various services. Existing content or services providers are likely to start partnering with access providers to offer "special accesses" that would be more profitable. Newcomers will not be able to make these can of deal and will be prevented to develop competitive new Internet services.

The example of Wikipedia Zero is a good example on how zero-rating can at first be seen as a good idea while it turns out wrong. Wikipedia is a collaborative encyclopedia meant to reflect knowledge of the whole humanity. But Wikipedia has a policy of only aggregating properly sourced information. This means that people accessing Wikipedia over a zero-rating offer will be highly limited in how they can actually participate in the encyclopedia. More disturbingly, users of Wikiedia Zero are limited in their ability to verify sources mentioned in the encyclopedia. Incomplete, misleading or fake information are regularly added in Wikipedia. While fixes usually happen fast, one can easily see how this could be dangerous.

Deep packet inspection is a technology first and foremost created for censorship purpose. Even when restricted for traffic management, it can way too easily be abused to deny users from their freedoms of thoughts, expressions, and organizations. The experience already shown that this mostly turns into an arm race between creators of DPI-technologies and censorship circumvention technologies.

The decisions about what type of traffic to prioritize should be left to users and not be taken by the ISPs.

Information from Internet Access Providers about speed, quality of service and any form of traffic management should be available to service users.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

---

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Our rights as end users for freedom of expression are more important than the monetisation of different speeds. If one service gets a fast lane, all the other services will get slowed down. This is by no means an environment that is fertile for a new economy.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Future innovation will be hindered through big monopolies who are able to buy themselves "fast lane" access. The internet will shift into a system where the big players are more likely to close their services, because they will pay for those services to be faster than the competition.

Is there a demand for specialised services? Which services should be allowed this special treatment? The only service I can think of that might have any reason to demand special privileges are emergency services.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know all the time if my ISP can see what I'm doing online, and I'd like to see if my ISP regulates the speed of any service differently.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the ISP should not be allowed to monitor our traffic at all.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Our ISPs should not be able to interfere with our internet connections.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Georg Auer

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for zero-rating for special services. If a user needs some data to be transmitted, he has to pay for it.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. No one should be allowed to analyse my traffic. Only ISPs need to know only one thing: To which device they have to deliver the data.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

All data needs to be threaded the same, independent of its type, origin and destination.

Priorising data for emergencies like the ambulance is ok, as long as this data is separated from all other data and also without economic interests. This prioritised data needs to be clearly defined, with its definition being public.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. No one should be allowed to monitor what I wear, or eat, what kind of soap I use or what I check out of the library either.

How much should your ISP be able to interfere with your Internet connection - for example to throttle or prioritise certain types of online traffic (video, P2P, etc)?

As long as no one is being hurt by internet content (as in obscene photos and videos generated through the infliction of inhumane acts) I don't believe any interference is necessary, or fair for that matter. Keep the net neutral.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Truth is shared through social media. The internet must become a public utility that it is.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

MainStream Media controls information in biased Orwellian ways.

Is there a demand for specialised services? Which services should be allowed this special treatment? Specialized services are proprietary to individual users, not ISP's. People Before Toxic Profit!

[www.WeAreOne.cc](http://www.WeAreOne.cc)

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference with free speech!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Maximum speeds as technology improves must be passed on to all users. Welcome to the 21st Century, and even the 3rd Millennium!!!

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yup! I feel yes! As an example, my photography site may go slow as a result of such policies...

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A lot! If someone has to pay more in order for their services to go faster, they may choose not to go for that service...

Is there a demand for specialised services? Which services should be allowed this special treatment?

None that I could think of.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO, NOT AT ALL!!!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Nothing, zero, null, nada!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all possible info...

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Wer kontrolliert und sanktioniert denn, wenn ein Provider anstatt wegen technischer Notwendigkeit aus kommerziellem Interesse heraus Internetdienste drosselt? Freiwillige Selbstverpflichtung funktioniert nicht wenn Milliarden locken!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Mir fallen keine positiven Einflüsse ein, aber sehr wohl dass die Spezialdienste meines Providers konkurrierende Dienste ausbremsen werden, z. B. dass das Filmstreamingangebot der Telekom höher priorisiert wird und dadurch andere Streamingangebote ruckeln und Aussetzer haben werden.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine, weil es nicht notwendig ist. Bereits heute werden kritische Anwendungen / Dienste / Datenströme nicht über das Internet übertragen, sondern über separate Leitungen. Beispiel Polizei: Extrapol ist ein eigenes Netzwerk das unabhängig vom Internet existiert.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Kein deep packet inspection, stattdessen nur anhand der IP Header.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es

ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Ronald Feicht

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It's shady commercial practice. I feel I'm paying too much for my data plan because of zero rating being offered for specific online services I don't use, as though it's supposed to guilt me into using said services.

I suppose in essence it's not that different from a TV advertisement or sponsorship in terms of how it's weighted towards certain brands, but I don't like TV advertising anyway, and I feel my options are being limited.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If the specialized service is not objectively necessary for a certain service and, even if it is required for a service to function properly, there isn't enough capacity to support congestion-free regular internet access at the same time, then it is stifling the internet as a whole.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't really know of much. (Even live video streaming seems to be doing fine on the regular internet.) I think there's little if any demand right now.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Please be as transparent as possible. I want to know if there's any risk of something breaking, I want stress-tests of how well online videogames work on it, I want accurate speed tests, maximum and minimum speeds, and I want all of that to be upheld.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. I don't want strangers invading my privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, as attempting to prioritize certain kinds of traffic messes with all kinds of traffic.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Guilherme Fernandes

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't see any specific service which should be allowed a special treatment by the ISP. If the ISP provides a SIP phone service and wants to prioritize that so that I can have a stable and clear audio connection, he should be obliged to do the same prioritization for any other SIP provider.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services are a threat to the future of an open internet. I'm a computer science student hoping to found his own startup some day, but I fear that when this day will come, I won't have a chance to compete as users would have to pay extra to use my new service, which will massively hinder future innovation in the internet.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

As an end user, I should have the right to use any service of my choice, which is essential for the free market to work and for competition between services. With zero-rating, I get a massive incentive to use that service and not its competitors, especially if it's a data intensive service like music or video streaming, because my mobile data rate is so limited. But it also works the other way around: If I'm already a user of a specific music streaming service, I essentially have only one sensible choice of which mobile carrier I get a contract with: The one which has an exclusive deal with that music streaming service for zero-rating it.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

An ISP should be allowed to prioritise or throttle general kinds of services but not single service providers. If an ISP decides to prioritize VoIP, they have to prioritize all VoIP traffic, regardless whether it's Skype, Google Hangouts, or the SIP provider of my choice, and not only their own SIP service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

It should be illegal for internet providers to monitor my traffic with deep packet inspection, as it violates my basic right to privacy.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I know that my current ISP does some quality of service and traffic management, but none of that information was from the ISP itself, it was all external information from other sources. An ISP should be bound to tell me that by themselves, so that I have all and current information on what measures to expect in beforehand when choosing this ISP.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Florian Jacob

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Corporations are manufacturing the demand for profit

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There's only positives to keeping the net open and neutral.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They could do what ever they like given the chance.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While specialized services could provide important information more quickly, it would also mean that similar services will be left out. Any new Web service wouldn't be able to stand up against existing services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

An ISP should provide an Internet connection as a service, and that's it. They have no right looking through my private Internet traffic.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know if my ISP is "managing" my traffic.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating is a bad idea. Zero rating would allow ISP's to interfere with the way the online experience is used, and would be a way to dismantle net neutrality. There is no demand by internet end users for zero rating.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positive impacts. Net neutrality is the best way for the future of the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand for specialized services for internet end users. No services should be allowed this special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP's should not be allowed to interfere with my internet connection in any way.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? A point could be made for SS for VOIP. It is just that shush an SS should not discriminate or dictate the type of program the client needs to use. But even without clients opting to pay a premium for shush a service, the other clients should not be getting a hampered VOIP service. So NO. No SS. the ISP's should do their jobs and provide quality service.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services, as explained here sound lovely and all. BUT there is a danger. It could be that ISP's will use it to sell highspeed/high capacity data bundles at a premium and selling slow, data limited bundles at a low (but still pricey) price point. This would create a rift between the poorer and the richer folks in the way they can use the internet. I think i'm against.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I am, provisionally, fine with zero rating. The provision being that all similar services are provided zero rating at no cost to them or the client. So to provide netflix with zero rating so should youtube, spotify, hbo and also minor players & start ups that also provide streaming audio/video. Or to zero rate the ISP's cloud storage they should zero rate all cloud services like dropbox, google drive, strato Hi Drive etc. It's all or none, at NO cost to the service provider and the consumer.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only when a user has a mix of data types and it is reaching the maximum transfer rate should they start to manage speeds, prioritizing packets like voip / streaming audio/video / realtime online gaming over mail, downloads, uploads etc. For the rest of the time they should do their best to provide top speeds for what their user is using his/hers connection for.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I suppose a page within your client info area at your ISP's site that provides a data log on what services you used and if and how they managed the speeds to provide you with optimal performance. And if, perceived, speed issues came from lacking data through put from/to a service provider (i.e. was Youtube unable to keep up with all the viewers?)

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's should, at most, be able to detect what type of service a packet is for and prioritize realtime packets (i.e. voip and online gaming data) over non time critical data like webpages, email, downloads etc.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Free internet traffic

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Angela Flowers

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Does "demand" refer to providers' ability to market higher speeds to customers with deeper pockets? I am certain that higher speeds can be sold to the highest bidder, but that ability does not make it right to marginalize or censor other content providers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The impact is the same as any place where profit is the ONLY driving factor: the effect on the majority is ignored, and brilliant innovations by "small players" are suppressed.

Is there a demand for specialised services? Which services should be allowed this special treatment? I know of none.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed, up & down. Specific traffic management policies implemented.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP must monitor destination address for routing, but CONTENT is PRIVATE. An ISP's interests and motives cannot all be known. Privacy and neutrality must be enforced.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not an easy question, because video, though requiring much bandwidth, carries much important content. I understand the need to balance load in some fashion, but I do not accept sorting packets into "lanes" based on any other attributes of content. The internet has become a de facto utility just as the telephone did.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Charles Berger

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
not relevant for me

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
limitations

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
why?

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Hopefully speed should be enough, assuming they aren't throttling

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Stefan Näslund

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
It creates a class of fast lane users.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
INNOVATION!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
no

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No service should get a special treatment!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
The ISP should not trottle or prioritize any traffic!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I should get the information I need in order to make reasonable assumptions about the quality of the service available.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
stephan pohl

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only to the extent of ensuring that every customer gets equal connectivity

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Tomas Kmieliauskas

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
It will discourage investment in Europe, if you want more tech startups, protect net neutrality.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Not sure, sounds like a bad thing

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I want to know that \*no management\* is taking place. No logs kept. Keep it transparent and neutral.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No, absolutely not.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Without a free "market", the internet will not serve the interests of all people and over time will become a tool of the powerful, wealthy and enfranchised. This cannot be permitted.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Emergency and vital government services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be able to do that at all, not one bit!!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of that sounds good.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand that I am aware of for "commercial practices" that restrict the functionality of the Internet in order to increase the profits of a rich few. For example, I would prefer to buy the ecologically friendly products of the Shamshadin region, one of the poorest in Armenia, rather than the chemical-laden over-processed "food" products of major agribusinesses: so I have no interest in being blocked by commercial practices that favor rich corporations over the people of Shamshadin (or anywhere else) simply because the rich corporations can pay to have their way but the poor cannot.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It should be obvious that any "specialised service" that restricts access to the Internet can only have a negative effect on the openness of the Internet. It should also be obvious that any censorship (restriction of an open Internet) can only have a negative effect on innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? There is no demand for specialised services designed to increase the wealth of the rich, at least from me. No service should be allowed "special" treatment based on the ability to pay.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISPs should not normally be allowed to monitor traffic for the purpose of traffic management.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not normally be able to interfere with Internet connections.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I should like to receive as much information as possible about my Internet connection, such as speed and quality of service. Unfortunately, I don't believe either of the ISPs I have used has ever tried to make such information easily available.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Ronnie Rouse

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Mr K J Brown

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREK net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Again, why should anyone be treated differently and controlled by where they go on the net or what they do? How would the administrators of such a company like to be followed home and monitored their actions and prevented from driving above 40 mph just because they were going someplace not approved by the ruling authority? How would they feel if they had to expose themselves to everywhere they went or have their calls taped for replay later? It is not that anyone is hiding anything - it is the right not to be oppressed or restrained because one is constantly being judged by another. Freedom applies to every facet in life and that includes the right to choose what we want to do, see, say or go - just as in the physical world, we are not restrained as long as we are socially correct, so should we be free to go about our lives just as freely online.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Restraint and control in the hands of one over others smacks of empire ruling and not a free society. Think about it. Creatively dies.

Is there a demand for specialised services? Which services should be allowed this special treatment? The current regulations should be enforced still and if anything, all new services with applications to become a specialized service should be scrutinized to check for correct guidelines before being issued new licenses. There is no reason we cannot coexist together done properly.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Privacy and fairness should be the cornerstones for guiding decisions when pertaining to all criteria.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There should be no allowance of independent thought or control by any organization without the approval of those that it gives service to - by the very definition of the word "service", denotes "doing an approved or desired action for a positive end" - it is not pleasing to any customer to be treated with unfair practices.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Transparency and honesty and clarity should be followed to provide on the website of any company that offers internet connection so that at any time, any customer can go up and view all the facts. again, it is about customer service and honest profit can be made by the numbers of satisfied customers, not profit that hinges on cutting corners, costs and cutting speed away from the customers that pay for the company service.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I believe zero-rating is good for fully open and non-profit resources such as Wikipedia but allowing zero-rating for things such as Netflix is damaging to end-users because they will cause harmful monopolies and will make it harder to access normal websites.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It will limit open access to information, causing serious problems for the world.

Is there a demand for specialised services? Which services should be allowed this special treatment? Yes, access to open and free information such as Wikipedia is needed especially in 3rd world countries.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Simpler systems are more than adequate.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I believe the only reason throttling/prioritizing should be used is when a certain user is using far more traffic than others.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Kevin Glazenburg

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

No, no, no to infinity. The US government gave internet technology to these present providers. The providers agreed to providing internet service to certain designated areas for all its customers. They have not provided this and the government has not enforced it. The internet is there to provide service to its monopolized area customers plus a small profit just like public telephone service to the population. The internet and/or telephone industry was never meant to be commercialized. It is supposed to be for the common good of the country's citizens, not to make billions of dollars for a commercial entity.

My name/organisation:

Joyce & Jerry Hansen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

No "specialized services" should be offered ever. All ISP customers have the same service for the same price not "specialized service" for those who can afford the extra money it will cost them. "Specialized services" will limit access, competition, innovation and increases the power of the ISP monopolies.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There can be NO "specialized services". If there is demand for "specialized services" they should not be considered "specialized services" but be provided to all customers of the monopoly ISP to all its customers for the same price. Without this, we would not have a free and open (not optimized) internet and lack the freedom we now have to make our own choices. "Specialized services" would bring the demise of our free /open internet, which is what happened to our free television that we used to have. Television is almost dead because of its monopolistic practices.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is NO Positive impact for ISP customers. Only a limitation of services and choice. The positive aspects of "Positive impacts" is more money, power, profits and control of customers and content for the ISP's, which would eventually lead to it's demise, just like television. Someone in the future will invent something better than the internet that is not monopolistic because the people. customers want freedom of choice and monopolies do not allow that. That is why it is so important to keep our internet open and free with no monopolies.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Commercial practices already do limit my rights as an end user. ISP's are rich, strong, powerful

monopolies that try and do make their own rules, to their benefit, not their customers. No ISP customer can compete or use their rights even now. But, the purpose of the internet is/was to enable democracy and the ability to compete with one another openly. No ISP customer can compete with an ISP, but they should be able to compete.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No government, intelligence agency (including police, FBI, NSA, etc.) or ISP should ever be allowed to read, monitor any ISP customer content or data/transmissions (for any reason). If an ISP, government agency, contractor, etc. wants access, they should be required to get a warrant from a US court (judge not fisa) after they present specific evidence such warrant is necessary and the warrant should specify the information, evidence that they specifically will be looking for. No open warrants.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

There should be NO interference allowed. All internet connections and service should be equal for all. There should never be a prioritization or de-prioritization, period. ISP's should provide excellent service to all and every customer.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, it is both limiting and discriminatory for everyone and should never be allowed!

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users? Please, provide examples.

ISP providers should provide their customers with adequate infrastructure and technical expertise so that traffic management would never be necessary. This is what ISP profit is for, to improve infrastructure and services, not to just pocket all profits.

What information would you need to make an informed decision about your Internet connection?

For example: traffic management; commercial practices or technical conditions?

Traffic management, commercial practices or technical conditions are parameters and information that should be provided to customers by the ISP, as long as they don't violate any laws or net neutrality. ISP customers and their providers should work together using best practices.

What information would you like to receive about the speed of your Internet connection?

Anything about speed (upload, download, etc.) that might help me utilize speed and maximize it.

250kb of speed is what we are stuck with, with our ISP monopoly. I've heard some have as much as 2gb for speed. Monopolies don't provide that here.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, all parameters should be defined in the contract. It should be written in easy to read and understand language and have a way to contact a "knowledgeable" customer service representative that fluently speaks your native language.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Sure, but only for traffic management.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf aus meiner Sicht. Auch wenn Daten nicht gezählt werden, erzeugen sie Kosten im Sinne des Gesamtvolumens. Diese Kosten müssen umgelegt werden, ohne das der Endverbraucher darauf Einfluss hat.

Für mich eine deutliche Beschränkung im Bereich der Kostentransparenz.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Ich sollte selber die Prioritäten setzen dürfen, nicht der Provider.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Verbrauchs- und Bandbreiten Informationen (bezahlte, angeforderte und genutzte (erhaltene Bandbreite).

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen.

Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Stephan Marx

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, ich wünsche keine Überwachung meines Datenverkehrs.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Quality-of-Service oder Traffic-Management)

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen,

es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Gerhard Weber

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

of course it could, it would allow large corporations to limit other organizations from providing services and or information

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

not allowing free, open, equal access limits competition

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating and commercially sponsoring types of traffic unfairly advantages large corporations, stifling competition and creativity as well as punishing the user/customer.

Is there a demand for specialised services? Which services should be allowed this special treatment? In some VERY LIMITED circumstances medical device data could be allowed to have specialised services, however it most definitely should not undermine other traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should never be able to throttle or prioritise private individuals' internet connections.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

- Verzerrung des Wettbewerbs
- Einschränkung der Auswahlmöglichkeiten
- Freier, ungehinderte Zugang wird eingeschränkt
- Kommerzielle Dienste werden vor freien Diensten bevorzugt

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich sehe leider keine positiven Einflüssen. Ein demokratisches, offenes Internet kennt keine "Spezial"-Dienste. Das Internet ist ein Abbild der realen Welt. Stellen Sie sich einmal vor, wir hätten "Spezial"-Dienste in der Alltags-Wirtschaft! Große Firmen würden bevorzugt und die Demokratie und Wahlfreiheit eingeschränkt.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Es gibt keinen Bedarf für Spezialdienste. Ein Anschluss hat eine Kapazität/Geschwindigkeit. Wenn jedes Paket gleich behandelt wird, gibt es keinen Bedarf vom Internetanbieter Dienste "speziell" zu benachteiligen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Der Internet-Provider soll auf gar keinen Fall den Inhalt meines Datenverkehrs mitlesen können! So, wie die Post/DHL/Transportunternehmen nicht mitlesen dürfen, wem ich etwas sende. Das Recht auf informelle Selbstbestimmung wird hier ganz klar verletzt!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Der Internetprovider sollte VERPFLICHTET werden, jedes Datenpaket gleich zu behandeln. Ebenso wie PKWs auf Straßen alle gleich behandelt werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das

Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The ISP had to transport the data, the content is private. The knowledge of the content could be used to discriminate the user or the content itself.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Hierfür gibt es keinen Bedarf. Ich zahle für eine Kommunikationsdienstleistung, und nicht für eine Beeinflussung oder Beschränkung derselben durch Provider. Die Priorisierung einzelner Netzdienste durch kommerzielle Praktiken geht zwangsläufig zu Lasten anderer Netzdienste und Nutzer, denn die Bandbreite wird ja nicht größer. Daran kann ich kein Interesse haben.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Auch das Internet hat eine endliche Bandbreite - zumindest was den Zugriff durch die Nutzer angeht. Eine Priorisierung einzelner Dienste/Angebote im Datenverkehr hat zwangsläufig eine Beschränkung oder Benachteiligung anderer Angebote zur Folge und behindert oder gefährdet so die Offenheit und Innovation im Netz.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? NEIN. Die Aufgabe eines Providers ist die Bereitstellung der Dienstleistung Internetzugang, die Kommunikationsinhalte und mein Nutzungsverhalten fallen unter den Schutz meiner Privatsphäre.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Ich wünsche keine Beeinflussung meines Datenverkehrs durch meinen Provider, ich betrachte das Drosseln egal welcher Dienste grundsätzlich als einen unstatthaften Eingriff in meine Rechte als Internetnutzer.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Confidential: No

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand. This would impact free speech as many smaller websites would be either insanely throttled or count massively towards the monthly usage (as they rely on ads on their sites in order to remain functional), resulting in less visits

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive is the fact that if you visited websites that allowed unlimited access, you effectively have unlimited internet (download and bandwidth speaking). However, as the WHOLE OF THE EU (and majority of the world) completely relies on internet now, why is a download limit still a thing?!

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No - there has never been a demand for such services. There is a demand for faster internet across the board. Fix the internet speed issue, then services such as this will continue to never be needed.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISP's in my opinion are very shady. Information (unless you are completely in the know) is very confusing; I think deliberately. Confuse people, they will then "to be safe" purchase a higher package so they "don't run out". Why? As I said, if you know the ins and outs of this information you can read through the bullsh\*t and see they are deliberately trying to shaft you at every moment. Slowing down at peak times? Why? Electricity doesn't "slow down" because more people are using it. I feel primarily, the main issue is majority of the internet/phone infrastructure is 1970/1980 technology which "falls over" a lot as it cannot process the amount demanded on a daily basis. BT (in the UK) are the main culprits for this as they are simply not installing their openreach service fast enough. It seems like a deliberate plot to p\*ss off as many people as possible so that plans like this service seem attractive.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, this would violate any privacy I still have (which is arguably not very much currently!)

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all - enable everyone to have access to fibre internet then there will be absolutely no need to prioritise internet traffic

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Jamie Lafferty

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Unequal internet access and discrimination by type of traffic would only strengthen monopolies and suppress innovation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Monitoring traffic content is a violation of the fundamental human right to privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should provide equal access for all and not be able to discriminate by type of traffic.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Nikolaus Leopold

Robert Ritter

The Internet should be fair and open, and there should be no throttling or censorship or blocking anywhere on the net.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I believe in the democratization of the Internet. Net Neutrality all the way.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Forget about innovation if the Internet becomes closed. Forget about democracy.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The Internet should be used as it was originally intended, as a free and open communication system for the world. We already have enough commercial domination in all areas of life.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They shouldn't have that right.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much as possible.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No,

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, nobody should be collecting and profiting from user data.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

All data should be treated equal and there should not be any reason to throttle anyone. We need to building out our networks to compete globally instead of giving access to the highest bidder and falling behind the rest of the world

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Peter-Jan Peters

I do not think that there is any service that can on one hand be served over the internet as specialised service and on the other hand could not be served in a best effort internet, except when the best effort internet is intentionally made slow to force that situation.

Zero-rating is a dangerous thing. If one service is zero-rated it is so much harder to start a competing service. But this competition is fundamental to a healthy economy.

ISPs should not be allowed to monitor the content of internet traffic.  
It is not necessary for their service, which is to provide internet access.

Internet access is a situation where there is a strong imbalance between participant. There is a huge number of customers with very little power on one side and there is a tiny number of internet providers on the other side. The providers sell a service that is extremely important to the everyday life of the customers. Therefore I think that it should be mandatory for the ISPs to make it completely transparent what they do with the packets of their customers.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that

cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No zero rating! I want to be free to use all Internet services, without someone manipulating my choices. I don't want my use of the Internet to become complicated by being presented with hazy and misleading "facts."

Is there a demand for specialised services? Which services should be allowed this special treatment? I am perfectly happy with what I currently have access to. Again, there's no need to complicate and interfere with my free use of the Internet. I don't want to have my online experience disrupted by redundant and unnecessary controls.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! I want a free internet, not one that routinely compromises my privacy for their own very questionable reasons.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Clearly stated information--not information written in language that is difficult for the average person to understand. People differ in the information that they seek about their service. I believe all the basic information that relatively computer savvy users need in order to get the optimal use of the Internet should be available.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Anything that purposely Makes something harder or easier to access than other things is discrimination and is not allowed. Nor should it Be.

Is there a demand for specialised services? Which services should be allowed this special treatment? Noone should.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not Be able to interfere with anything, without my documented consent

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to have easy Access to all of it.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Wenn ein kommerzieller Anbieter für die Verbreitung seiner Produkte das Internet nutzt, sollte er für diesen Marktzugang zahlen, hier wäre ein geschwindigkeitsabhängiger Preis auch angemessen. Meine private Internetnutzung sollte aber nur durch die technischen Möglichkeiten eingeschränkt werden und evtl. Infrastrukturkosten in Regionen, deren Versorgung mit hohem Datendurchsatz für die Provider nicht wirtschaftlich durchführbar sind, sollten durch Steuergelder finanziert werden. so das alle Bewohner eines Staates die gleichen Möglichkeiten zum Netzzugang haben.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich habe kein Problem mit der Möglichkeit für Provider für kommerzielle Dienste einen geschwindigkeitsabhängigen Preis zu verlangen, wer weniger Zahlen will muss dann in Kauf nehmen, das beim potentiellen Kunden der Seitenaufbau langsamer vonstatten geht oder muss auf die Nutzung von datenintensiven Contents verzichten, für alle anderen Kunden des Providers muss der Zugang immer den technischen Möglichkeiten entsprechen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Für lebenserhaltende Massnahmen könnte man eine Mindestbandbreite vorsehen, deren Wirksamkeit dann zu einer Drosselung des sonstigen Verkehrs führen dürfte.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nur wenn es technischen nicht anders lösbar ist

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Bei kommerziellem Streaming sollten die Kosten der Datenübertragung durch den Content-Lieferanten bezahlt werden, der dies über seinen Preis an den Kunden weitergeben kann, alle Privatstreams sollten keinen Zusatzkosten bzw. Datendrosselung unterliegen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Die Informationen sollten vor allen Dingen vergleichbar sein, so dass die Leistungen der Provider auch direkt verglichen werden können; zudem sollten Soll-Ist-Vergleiche die Diskrepanz zwischen versprochenen und realisierten Leistungen zeigen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität

verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Reinhard Zölle

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Such practices only encourage corrupt behavior. Level ground is the only fair approach.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There has been example after example of how information sharing on the internet has made real positive change happen. It transcends governments and businesses alike. A place where freedom for the world is preserved is key. This isn't a lofty notion, it's cold hard fact. Something has to be there to facilitate checks and balances when someone steps over the line. It's healthy for society.

Is there a demand for specialised services? Which services should be allowed this special treatment? I can only imagine that emergency services or those providing life saving or incredibly time critical functions could deserve such treatment. It shouldn't be about money. If a business can't buy a lane on the highway for their employees to exclusively use, or be able to increase the speed limit for just their people, they shouldn't get such treatment on the internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Use of traffic monitoring should be very specific and limited. It has the potential for a significant amount of negative repercussions for internet users and should be treated with that level of care.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. They are selling me bandwidth and volume (max gigs per month etc.), how I use it is my business alone.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would appreciate ability to easily access such information, though I wouldn't require to have it delivered to me in any specific format.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Jared Goor

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

negative: detrimental to freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

no

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

speed and quality

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

shouldn't

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! This is my privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The smallest amount possible to ensure a widely neutral web.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

what is relevant for me to see how my provider handles my traffic

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Dieser Bedarf besteht nur bei zeitkritischen Diensten. Der Kunde soll bestimmen können ob und welche Dienste das beinhaltet.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Die Möglichkeit sich für Spezialdienste bezahlen zu lassen, motiviert Provider die Geschwindigkeit für andere Dienste zu drosseln.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken?

Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Der Kunde muss selbst bestimmen können ob und in welchem Ausmaß er will dass zeitkritische Dienste bevorzugt und andere benachteiligt werden. In keinem Fall soll der Provider die dafür erhobenen Daten speichern oder mehr Daten als nötigen erheben dürfen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein, dies wäre ein Eingriff in meine Privatsphäre

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

So viel Informationen wie dem Provider zu Verfügung stehen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen

wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Roman Amblank

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If Facebook can afford to strike deals with some ISPs to pay for my access to their content it interferes with my ability to select a service provider based only on the quality of their service. Now I must also consider their preferential agreements. Content providers should be forced to compete on the quality of their content, not by their capacity to buy access to consumers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services improve access to some content and businesses at the expense of others. Overall this is bad because it reduces competition in the marketplace. It gives existing, entrenched content and businesses an undesirable advantage over new innovations.

Is there a demand for specialised services? Which services should be allowed this special treatment? Unfortunately the demand is from the large content providers and ISPs that stand to profit, not from consumers who already control which services receive special treatment: the ones that they choose to access, based on their competitiveness in a free marketplace.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

I know best which traffic is important to me, not a patronizing ISP.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. ISPs claim they want to improve customer experience, but they consistently service their own interests above those of their customers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Upstream and downstream bandwidth, any rules like bursting, peering agreements that bury content close to the edge of my ISP's network, whether traffic prioritization is happening.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Jack Bates

Freelance VFX Artist

Is there a demand for specialised services? Which services should be allowed this special treatment?

i can't think of any

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can imagine that people in remote locations might have better access to public/health information, or online banking if those packets were to be prioritized. However, the widely known dangers here far outweigh a few slight potential advantages.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

i don't believe that there is demand from the consumer side. it will also disadvantage new enterprises who can't afford to enter a market already rigged against newcomers. Existing companies would obviously work with ISPs to create disincentives for customers to use a competitor's service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

They should absolutely not be allowed to monitor their customers traffic

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Personally, I don't see how it should at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

There should be standards in place for what ISPs have to tell the customer, and how it must be phrased in order to be as easily understandable as possible. Additional, in-depth information must be easily accessible by request

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Sehr geehrte Damen und Herren,  
Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Quality-of-Service

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein. Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for zero rating. Manipulation of traffic is merely a way to censor the internet and rip off customers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The ISP should merely be a data pipe with no control over content. The customer should have total control over content.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No services should be allowed special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should be forbidden to interfere with my internet connection.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive speed, quality of service, and how my traffic is managed.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The internet is and should always be free and open to everyone, not just big compaines

Is there a demand for specialised services? Which services should be allowed this special treatment?

None at all

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Everything

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Luke

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, it actually limits search options in the long run by giving me what the algorithm thinks I want rather than let me find it myself.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Only if it ensures better connection in some way

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
james allen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not, this would be a huge breach of privacy. ISP should just fill in the pipes, not monitor the content...

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should only be the warrant of a fair and equal access to online resources : bandwidth limitations have to be applied to everyone; or nobody.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein, es gibt keinen Bedarf. Ein Provider könnte allerdings werbegestützte Angebote (z.B. Nachrichtenportale), die unter seiner Kontrolle stehen, mittels Zero-Rating bevorteilen und damit einerseits den Wettbewerb schwächen und andererseits seine Nutzer manipulieren.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Grundsätzlich reduzieren diese Spezialdienste die Offenheit und bremsen die Innovation

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein, kein Bedarf

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein, das verletzt meine Privatsphäre und ist ein Einfallstor für weitergehende Überwachung.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den

Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Christian Rolfes

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Henrik Hüttemann

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating for every or none service would be right. Everything else would be unfair competition.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

There should be no interference at all. If the bandwidth is not enough, the ISP has to provide more.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much as the ISP has, so I can decide whether it is worth the money or not.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content

application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I do not want any "commercial practice" related to zero-rating. It would be dangerous for net neutrality.

For example I had a zero-rating applied to one particular search engine, information source (press, blog platform, ...) or online marketplace I would, as a end-user, be more inclined to use those rather than others. This would reduce the number of sources from where I forge my own opinions and convictions, this would reduce my privacy and make me more traceable online. Finally this would reduce economic competition because the marketplaces not under the zero-rating would be less attractive, thus reducing my strength, as a customer, to chose between all marketplaces.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized would restrict the future innovation and openness of the Internet because, to be viable, innovation would have to come from entities already being a specialised service because all the other sources of innovation would be restricted.

With specialised services the Internet is no longer open it is restricted to the specialised services: for example, if I want to chose my email provider I would be forced to chose one who is a specialised service because it would not be practical to use instead.

Is there a demand for specialised services? Which services should be allowed this special treatment? None, I want to be able to chose where I go on the Internet without wondering if it will be slow because it is not a specialised service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, they can't monitor my traffic, they are an ISP they must remain neutral. Otherwise it would lead to conflicts of interests.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not unless under very specific contracts that I specifically chose because it fits my needs.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

My maximum AND minimum guaranteed download and upload speed. What information is logged when I'm on the Internet and for how long. How is traffic managed. What is my minimum guaranteed quality of service.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISPs should not be allowed to interfere with internet connections.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Scott Evans

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

NO. YES, COMMERCIAL PRACTICES MAY VERY WELL LIMIT MY RIGHTS AS A CONSUMER.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

SISPECIALIZED SERVICES WITH PRICE DISCRIMINATION WOULD VIOLATE THE RIGHTS OF ALL USERS AND HAVE A DEVASTATING EFFECT ON INNOVATION AND OPENNESS.

Is there a demand for specialised services? Which services should be allowed this special treatment?

PROBABLY. I CAN THINK OF NO CONSUMER SERVICES WHICH SHOULD BE ALLOWED SPECIAL TREATMENT.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

HOW MY TRAFFIC IS MANAGED.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.
