The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Wendell F Perks Jr

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Lois Jordan

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, such practices would limit my rights as an end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services would severely inhibit future innovation and openness of the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
There is no demand that is an acceptable reason for allowing special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know the speed, quality of service and how traffic is managed on my internet connection.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. -----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Kind regards,

Asunción Lorenzo Rodríguez

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
My ISP shouldn't interfere with my internet connection at all. They should just give the me and other subscribers what they pay for - use of the Net in whatever fashion they desire.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Sehr geehrte Damen und Herren,  
Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Ulrich Doebler

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf, das Internet soll und muss für alle Nutzer gleich schnell sein.  
Es würde einer Zensur (Diskriminierung) gleich kommen wenn Menschen auf Grund ihrer Finanziellen NICHT Möglichkeiten schlechter gestellt werden.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Finanziell potente Unternehmen werden ihre Markt beherrschende Stellung weiter ausbauen und somit auch das Internet Monopolisieren. Für kleine Firmen wäre da kein Platz mehr und die doch allseits so hofierte Vielfältigkeit würde für immer verschwinden.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN das soll er NICHT

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Überhaupt nicht

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist

besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
alle Menschen

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no such demand. What's more, they interfere with my free choice of competing services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would further promote a concentration of power and control in the hands of a few, large companies.

Is there a demand for specialised services? Which services should be allowed this special treatment?

The demand is there, e.g. medical, emergency services, but these shouldn't be conducted through the regular www anyway, but should use their own, dedicated connections outside the www.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like clear, understandable and comparable information about how my traffic is being managed.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, this should not be allowed.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP shouldn't be allowed at all to interfere with my connection based on content or provider.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Gunnar Grah

Dear Sir or Madam,

My Name is Markus Riemer and I live in Göllersdorf, Austria. Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Markus Riemer

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand. Commercial practices such as zero-Rating would Limit my rights as an end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised Services must be avoided in order to protect freedom of communication, competition and Innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand. No Services should be allowed this or any other Special Treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive Information about the average available Speed with a specification of the Maximum and Minimum Speed. The Internet Provider should not be allowed to Display the maximum possible speed as being generally available.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

YES

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NEVER

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ALL OF THE ABOVE

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

As an end user zero-rating and other such "commercial practices" use conditioning to steer consumers towards services "preferred" by ISPs.

An example: Hulu pays ISPs exorbitant fees to be added to the zero-rated list but Netflix doesn't. Therefore if I, as a consumer on a dataplan, watch programs on Netflix I am punished by losing available bandwidth. Therefore watching on Hulu is consumer-preferred to save bandwidth. Therefore Netflix is a less valuable property and Hulu begins monopolizing the market.

Continuing this example outward, any new company that starts a streaming service starts at a disadvantage and can fail due to monopolistic practices rather than any deficiency that exists within their business practices. Then the ISPs can demand higher fees from Hulu that they will have no choice but to pay to retain their new majority market share, eventually innovation will stagnate in the streaming space due to the monopoly held by Hulu and the ISPs draining off the majority of the extra money they made from monopolization. So even the company that paid to get ahead is, in the end, disadvantaged by the so called "commercial practices".

This is only one example but there are many others if you take the time to think of them.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't believe any enterprise should have specialized service access. At least not if they can not conclusively prove to a specialist board of examiners that the service wouldn't function on the open internet. This is not a situation where companies can be trusted with loose wording of the law (as if there ever was). Otherwise it disrupts the internet in much the same way as zero-rating, only worse. It would function much like zero-rating while also adding in discrimination based on what /type/ of device you are accessing the service with. It adds in the ability to exploit consumers by not allowing access to a service based on what hardware you are using.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services should be heavily limited if allowed to exist at all. Otherwise, they would break the internet into islands. The original patent that makes the internet possible was distributed freely to prevent that very event. If specialized services that didn't absolutely require additional quality were allowed to exist then soon enough the internet would break down by ISP. Speeds would change based on whether or not the manufacturer/provider paid extra to your ISP provider to have connectivity between what device and services you use at an optimal speed. The internet I am able to use and the internet my next door neighbor are able to use would be different even if we paid for the same speed if we happened to be different ISPs, or if we were on the same ISP but I used a PC and my neighbor used a Mac.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know everything about my connection. I want to know up-to-the-second why access to a site is slow at certain times and not others, why my internet isn't as fast as I paid for at some time, everything about what they do should be clear and concise in order for me to make good decisions. Not that getting clear and concise information excuses bad practices at all. It doesn't. It should be helpful not clearly telling me how bad they are screwing me and that there is nothing I can do about it because they are the only ISP in my area.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. My packets are to be sent /through/ them. Not be read /by/ them. All packets should receive equal priority. deep packet reading only allows for biased delivery practices.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. If I ever find out my ISP is doing this to me I will discontinue my subscription with them for another services that promises, and delivers on said promise, to not throttle my connection, even if it costs more and has a slower download rate.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Jonathan Grant

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

In my understanding, commercial practices are all limitations or restrictions of basic network functionality which are not necessary for ensuring the network to function.

Subscriptions of media services provided over the internet should not be seen as banned commercial practices as long as their internet traffic isn't handled differently from the rest of the traffic. There explicitly shouldn't be any zero-rating.

Zero-rating itself shall be seen as a banned commercial practice.

My name/organisation:

Oliver Schmidt

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers?

What are the characteristics of such services that would justify the fact that they are not offered over the internet?

"Specialised" or "optimised" services shall not be comparable with usual internet services. Services which used to be accessible from the "normal"

internet, can be accessed as part of the "normal" internet from another ISPs network or can somehow be realised as a normal internet service shall not become "specialised services".

"Virtual dedicated lines" which interconnect a certain set of locations of a company by renting a certain reserved capacity in the backbone and ensuring a quality of service by using the fastest route are a valid possibility if they are only used to interconnect these exact locations, then they act like a kind of dedicated line connecting a set of ethernet ports.

They shouldn't be allowed to provide a "fast lane" for a company to prioritise their service on its way to end-consumers. An example for that would be a video streaming platform buying a QoS-ensured "fast lane" to the network of the Deutsche Telekom with the aim of having a fast lane to each of their customers. This should not be allowed because the video streaming platform wouldn't have bought a dedicated line to each of their customers either.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

I really cannot think of such a service except maybe public emergency calls.

But these are just VoIP calls which first don't need much bandwidth and second can be prioritized over non real-time traffic by the end-customer's network router like other VoIP calls (end-to-end principle of the internet).

If e-health requires a real-time connection for critical operations, these operations are better off to take place in a specialised facility having a dedicated line to the other communicating side. Other solutions are way too dangerous for the patient.

Autonomous cars must have enough sensors and processing power to keep working without an external internet connection. They mustn't depend on receiving realtime or critical data over the internet, otherwise they have to be seen as unsafe technology. Data from the internet may only be used to provide additional information like traffic information, which can partially also be transmitted through mesh-networking between cars.

So apparently there is no need for "specialised services" as each problem is better to be solved at the endpoints of the connection itself.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Negative impacts of specialised services:

Reducing competition and innovation in the market as big established services can afford "fast-lanes" through specialized services while new competitors like startups can't afford these.

They'll probably also lead to monopolisation among ISPs as companies buying a specialised services will only do that at big ISPs, not at small communal ISPs. The specialised service may then appear to be faster for customers of a big ISP than for those of the small communal one or may not be available at all.

Fragmentation of the internet & service market: Customers can't rely on being able to access a service when having an internet connection, no matter which ISP they get their connection from. This may lead to a fragmentation of services only being available to customers of certain ISPs while customers of other ISPs can't access these services at all or only with a worse quality, although having an equivalent internet connection (e.g. both customers have a VDSL 50MBit internet connection). This is an issue as a household may not be able to choose between all ISPs due to limited regional availability.

Do you think that commercial practices could limit your rights as an end user?

Could you provide examples?

Commercial practices can limit some of my rights like freedom of expression and dialogue by not having equal possibilities in deciding where to publish information and texts describing my opinion as the zero-rated services may not allow this because of restrictions in their terms of service or I can't reach everyone through the platform.

They also limit my right of free access to information as they create an additional barrier for accessing information on non-zero-rated services (e.g. extra payment/ longer loading time). Commercial practices like zero-rating also limit competition between services as they also provide an advantage only a few big, established companies can afford.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Traffic monitoring like DPI is a privacy-violating technique used by oppressive regimes and must not be allowed. The regulation prohibits specific forms of traffic monitoring.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

According to the end-to-end principle of the internet only end-users shall be able to decide how to prioritise certain types of traffic in their own end-device (e.g. their internet router). ISPs shall only be allowed to interfere in this prioritisation if this is necessary to resolve a congestion in the network. They then have to use only categories which are technically necessary without categorising the traffic after commercial criteria.

A problem with prioritisation of traffic is that encrypted communications may not be categorized properly and because of this discriminated against in comparison to unencrypted traffic of the same type.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Traffic management shall not limit my choice between certain services, products or types of communication. This can't be guaranteed as every user may have different priorities or different technical requirements. Also some traffic, especially encrypted communication, may not be categorised properly and though be discriminated against in comparison to unencrypted traffic of the same type.

Because of that discrimination mustn't be allowed and traffic management has to be temporary and only if technically needed to resolve an actual congestion. It must also be application-agnostic.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples. Reasonable traffic management is application-agnostic management technically needed to resolve an existing traffic congestion. It must be temporary and stop as soon as the congestion is resolved. Unreasonable traffic management is e.g. application-agnostic traffic management as it restricts my choice of application usage. Every form of traffic management interfering or limiting my ability to access specific points on the internet can be seen as restricted access as the service/ point I want to access is not available to me in the quality as it could be.

What information would you need to make an informed decision about your Internet connection? For example: traffic management; commercial practices or technical conditions?

At first, discrimination doesn't become less discriminatory when it's done transparently. I may not have the choice to become customer of a less discriminatory ISP because of limited regional availability or because such an ISP doesn't even exist.

While transparency isn't enough, it's still necessary. It shall use a standardized terminology between all ISPs which needs to be understandable without technical or legal knowledge. Practical and representative examples of traffic management and discrimination have to be given.

What information would you like to receive about the speed of your Internet connection?

I want to have information about the average, maximum and minimum speed of my connection. If there are certain patterns in the availability of certain speed levels (e. g. the internet becomes slow in the evenings) I want to get these information, too, in a way easy to understand (e. g. speed graphs)

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Information about all parameters influencing the quality of the connection need to be given (e. g. jitter, latency, packet loss) together with representative examples of their real-life consequences (e.g. video delays, sudden audio errors). These information are needed to make a well-informed decision when choosing an internet access suiting my needs.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Oliver Schmidt  
student of computer science and German citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No. Es should be allowed no Servies.

Positive impact for hospitals when in an accident, the patient in the ambulance is and his data on his injury directly to the hospital received .negative impact.Wenn to the whims of the controls are delivered randomly.

it is known that such business practices .For the one or other consumer-is with safety his election negatively .if customer reviews 100 negative and 5 positive. do not buy the customer.

no way

the ISP should it not allow to interfere with the internet and to curb

traffic has no Internet users to sniff right in the privacy of the round.

who we infos internt speed, quality then ask our providers.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
P2p filestorage

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
A little bit only and transparently

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Video conferencing, VR/AR could require dedicated bandwidth for optimum service. Should NOT impact internet access. If a service provider cannot guarantee the bandwidth for these services, should not throttle other services to be able to deliver these specialised services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

- + Guaranteed QoS for video conferencing
- Telenet fucking with my Netflix streaming

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NEVER

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Upload/download speeds - ideally not asynchronous.

QoS agreements for dedicated services like Video conferencing / video and VR streams

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No real demand, just a gimmick. Don't mess with my internet. WWI, WWII, WWW!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Discourage them!

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No way!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Zero

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Any and all info.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. ---

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I'm not sure I'm qualified to give an opinion on this. I would suggest that where any specialised service gives a better service to the user without additional cost to the user, the current regulations appear to be quite fair and in order.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

As things stand, the internet provides a level playing-field. Not only would it be unfair on the innovator to be debarred from sharing his/her work, should they choose to do so, on grounds not having enough money, it might very easily be a loss to the wider world which never gets to benefit from said innovation.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I'm sure there's a demand for commercial practices such as Zero Rating, just as, regrettably, there are demands for illegal pornography, illicit drugs and sites that tell you how to manufacture arms and bombs, but demand on its own is no justification.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

There is a considerable amount of theft. Many people believe it is their right to download films, books, music and other things for free. It is not, and the arts and humanities particularly are suffering from this widespread theft of intellectual property. Therefore, in cases such as this, or in cases where the content is in other ways illegal, the ISP should 'throttle' sites that encourage this practice. Throttling or prioritising on purely commercial grounds is anathema.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. That would be like allowing the police to conduct a search without a warrant.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

My ISP seems to fit the criteria laid out in the 'extra information' section of this page.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Willis Gravelle

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I don't believe there's a consumer demand for "specialised services".

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Limiting my overall bandwidth could be fair if I were on a limited-data plan, but otherwise, my Internet connection should not be hindered compared to other customers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I believe that my ISP is obligated to keep me informed as to my Internet connection's speed and how the company would attempt to moderate overall traffic as it affects my use of the Internet at any given time.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Timothy Miller

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

zero rating favors the biggest entités and unfairly limit the ability of small entities and individuals in their publishing capabilities and their rights. This is a roundabout way to discriminate by presenting yogurt as half full rather than half empty and it is certainly bad for us.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services are not internet and should under no circumstances be confused.

Is there a demand for specialised services? Which services should be allowed this special treatment?

If an ISP would provide a specialized service (current television ...) it must bear the transport and load outside of Internet.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, it's counter-inovative, counterproductive and pervert

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP must provide the flow for which I pay without interfering in any way whatsoever.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISP should have obligation to provide me transparently all the information on the characteristics and the actual state of my connection and services, with standardized terminology, and inform me of comprehensive and technically relevant way disturbances and monitoring of progress.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO! No website should be allowed to track it's visitors! Peoples personal information SHOULD NOT be allowed to be used by a website for their benefit and profit unless the user agrees to let them do so, and the default should be no. If they're a business they need to charge for their service instead of behind the scenes selling and using personal information. The advertising industry, if it can be called that anymore, needs to be reigned in as well.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NONE! Unless users are using huge amounts of bandwidth, regularly.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Mahdi Benadel

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No. Period.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

They should not be allowed to interfere at all.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

All of it.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Es gibt dafür lediglich einen Bedarf bei den Internet-Riesen, die sich eine solche Praktik leisten können. Damit werden junge, innovative Dienste diskriminiert und Entwicklungen unterbunden. Das muss verhindert werden.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Spezialdienste wären für zeitkritische Dienste denkbar, die ein öffentliches Interesse bereitstellen. Z.B. Online-Notruf

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Auf keinen Fall!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? gar nicht, ich will jederzeit, für alles was ich tue, die von mir bezahlte Bandbreite nutzen können.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Ich möchte umfassend über das Produkt, was ich bezahle, informiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den

Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Jan Felix Stridde

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein, diesen Bedarf gibt es nicht. Dies verzerrt den Wettbewerb. Nur bei gleichen Bedingungen für alle Anbieter (auch Einsteiger in innovative neue Geschäfte) herrscht Anreiz für ständige Innovation im Wettbewerb.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Diskriminierung von finanziell schwächeren Anbietern (Innovationsmangel), Bewertung von zu genehmigenden Spezialdiensten öffnet Lobbyismus und Korruption Tür und Tor.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Nein

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Durchschnittsgeschwindigkeit, PING, Verfügbarkeit, Verhältnis langsamste zu schnellsten Paketen im Netz.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

gar nicht

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Christian Hoffmann

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
not at all!

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Kathryn Lindstrom

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Network providers should be allowed to offer any specialised service to me, as long as I can still use the Internet. There should be fair world wide interconnection rules between carriers. Bandwidth should be distributed between services according to my willingness to pay for a service! I am not willing to pay the same price per kbps for high bandwidth-consuming VoD-Services as for low bandwidth-consuming VoIP-Services.

Negative: Services like IPTV will be so expensive, I will not use it! Why should it be only the user to pay for the network? Why should we ban business-models, like advertisement-based services from the Internet? Look at the capitalizing of content-owners (like Google) and compare it to network-owners (like Telefonica). Why should it be allowed, that Google can monopolize Content-Offers, while Telefonica has no right to let Google pay for the access to it's customers.

As long as I have a choice of ISPs, I can't see a problem in zero-rating! We are living in a system of open markets. Why should an ISP be limited to what he is offering to it's customers as long as the customers can choose from several offers? My right as an end-user is to have choices. Markets will sort out the rest!

There is no need to monitor the traffic, if there is a sufficient interconnection model.

As long as the ISP clearly states it's policies and there is a choice of ISPs available, there is no need for additional rules. Let the market decide!

As much information as is understandable for most customers and technological reasonable. Apart from DSL-connection speed in an TCP/IP network, there is not much more information, that most of the customers will be able to understand!

Kind regards,  
A concerned citizen

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't want zero-rating. For example t-mobile does zero-rating with Spotify, Vodafone with Deezer. When a new service comes up that is better than Spotify or Deezer, it will have a harder time to compete because zero-rating introduces a new entry-barrier into a market. And economics 101 tells us that entry-barriers should be as low as possible to increase competition and increase the efficiency of the market. Zero-rating is a market distortion that brings only utilities to already existing companies with a certain amount of resources.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are positive impacts? There are only negative impacts. Competition decreases, thus market efficiency decreases, Schumpeter's creative destruction will have a harder time because of higher market barriers. Everyone except the ISPs loose. The customers will pay in the end more, new market players will have a higher entry barrier because they can't afford to pay to get fast to customers, existing companies have to pay ISPs in addition to the customers of the ISPs who already pay. It's a win-loose-loose-loose-situation and the only winner are the ISPs which are already situated in a market with high entry barriers.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No. There is no demand for specialised services. Even something like a remote medical procedure would be done with specialised networks because using the internet for something like that could just bring too many problems while using such a critical application.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and possible speed (am I throttled by default) Quality, Traffic management, Plans in my area of living about increasing internet infrastructure, so that I know if and when I might be able get access to faster internet, plans for implementing modern technologies like IPv6

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

It depends. Real-time-critical traffic should be prioritized but other traffic shouldn't be de-prioritized. And there shouldn't be discrimination in the same service class.

They should be able to monitor for real-time critical applications, so that for example they can prioritize voice-over-ip-traffic over e-mail for example. But they shouldn't discriminate between the voip-traffic (i.e. their own or that from another provider used in their network) in that case. They should also not be allowed to reduce certain services at all times. For example reducing P2P-traffic shouldn't be getting throttled down just because it is P2P-traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It should be allowed to prioritise certain traffic but not be allowed to throttle certain traffic.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Das Zero-Rating dient als Mittel um nicht kommerzielle Inhalte zu drosseln. Hierbei besteht die Gefahr das gedrosselte Internetseiten viel seltener aufgerufen werden. Die wenigsten Benutzer wollen minutenlang warten bis eine Seite angezeigt wird. Damit ist das eine Form der Zensur durch den Provider, und er entscheidet welche Inhalte er zensiert. So ist es ihm möglich bestimmte Seite die sich kritisch über das Unternehmen oder dessen Geschäftspartner äußern, so zu drosseln, das ein normaler Aufruf der Seite nicht mehr möglich ist, die Kritik bleibt somit ungehört! Das bietet Providern die Möglichkeit Neukunden zu werben, indem er das Image des Unternehmens besser darstellt als es in Wirklichkeit ist. Auch ein Blogger muss die Möglichkeit bekommen seine Meinung zu äußern, ohne dass sein Recht auf Meinungsfreiheit durch Drosselung des Providers eingeschränkt oder gar verhindert wird.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Das Internet konnte nur so groß werden, weil es frei, neutral, und dezentral Verwaltet wurde. Es dient heute der Kommunikation von allen Menschen, unabhängig von, der Herkunft, des Glaubens, den Ansichten oder der sexuellen Orientierung. Das sind gelebte Menschenrechte, die auf der Freiheit des Internet stehen. Wird diese Freiheit eingeschränkt, so werden auch die Menschenrechte eingeschränkt, zu Gunsten der wirtschaftlichen Interessen einzelner Konzern. Deshalb muss die Freiheit des Internets besonders geschützt werden, gegen die Interessen einzelner!

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Nein, jeder hat die Möglichkeit seine Dienste nach seinen Vorstellungen ins Internet zu stellen. Die Nutzer werden dann entscheiden welcher Dienst sich durchsetzt und welcher nicht. Die Aufgabe der Provider ist es lediglich ein ausreichende Bandbreite bereit zu stellen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, die Provider sollen den Transportweg für meine Daten bereitstellen, der Inhalt meines Datenvolumens ist dafür irrelevant! Die Post öffnet auch nicht die Pakete, um zu sehen welchen Inhalt sie haben, um dann zu entscheiden wie schnell sie zugestellt werden. Wenn Nutzer des Internet unterschiedlich behandelt werden, auf Grund ihres Nutzungsverhaltens, dann verstößt das meiner Meinung nach gegen die Menschenrechte in den es heißt, alle Menschen sind gleich! Ein weiterer Punkt ist dass das Internet nicht einzelnen gehört, sondern uns allen! Die Provider stellen lediglich den technischen Zugang her, das ist aber nur ein kleiner Teil des Internets. Wenn Provider gleichzeitig kostenpflichtigen Content anbieten besteht dort außerdem ein Konflikt zwischen ihren Pflichten, als Provider neutral zu sein, und den wirtschaftlich Interessen des Konzerns. Das führt dazu, dass am Ende ein Monopolist entsteht, es zu negativen Folgen für die Internetwirtschaft kommt, was am Ende Arbeitsplätze kostet und der Wirtschaft insgesamt schadet.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Ein Provider stellt lediglich die technischen Voraussetzungen für den Zugang her. Wie dieser Zugang genutzt wird, hat ihn nicht zu interessieren. Wenn ich mir einen Fernseher kaufe, dann wird mir auch nicht vom Hersteller vorgeschrieben wann ich welche Programme auszusuchen habe. Dasselbe erwarte ich von meinen Providern. Das Internet ist nicht von den Providern erschaffen worden, ganz im Gegenteil, sie waren Nutznießer der digitalen Revolution. Jetzt versuchen sie die Kontrolle über das Netz zu übernehmen, um anderen Unternehmen die Chance zu verwehren ihrerseits vom Internet zu profitieren. Dass ein Netz das unter der Kontrolle eines Konzerns steht, nicht funktioniert, zeigt die Geschichte. Als Beispiele sind hier der Telekom Dienst BTX, und das Microsofteigene Netzwerk MSN zu nennen, die beide grandios gescheitert sind.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Heute kauft man die Katze im Sack, da die Angegeben der Datenrate nur der Maximalwert ist, der erreicht werden kann. Es gibt aber keine Untergrenze die angegeben werden muss. Solche Daten und auch wie welche Dienste durch das Netz geleitet werden und mit welchen Übertragungsraten, müssen veröffentlicht werden, da ich als Kunde sonst keine Möglichkeit habe zu prüfen was ich kaufe. Außerdem sollte der Provider verpflichtet werden, die tatsächliche Übertragungsraten die während der Nutzung durch den Kunden erreicht wurden, monatlich mit der Rechnung an den Kunden zu übermitteln. Eine weitere wichtig Information die vom Provider veröffentlicht werden muss, ist welchen Zugriff der Provider über den von ihm gelieferten Router auf das Netzwerk des Kunden hat. Hier sollte gelten das bei der Anschlussdose für den Router der Zugang des Providers endet.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Carlo Mertins

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Brian Clifton

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for commercial practices. As already said - provide fast internet in general. Otherwise it will be hard for startups and little services while big companies become even more untouchable. This will be counterproductive to innovation.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I can not see any positive aspects beside in very special areas of e.g. real-time applications for science and health. Negative impacts are obvious: It is bad for all services which are not well-known, it is bad for every company with lower budget and it is bad for every internet user which is performing unconventional activities.

Is there a demand for specialised services? Which services should be allowed this special treatment? Not really. As already said - if even - very special cases which are important for humanity in general e.g. health and science.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much information as possible but in a clear, structured, understandable way. A consistent, strong internet connection with no lags is more important than speed alone.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not. Surveillance by the ISP for the purpose of traffic management is a no go. This information may be misused. The traffic management is undecidable in a fair way.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not in any way. Provide fast internet generally everything else will lead to inconsistencies and unfair treatment.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't have any demand for that. It could limit my rights, possibly. I'll need to learn more about it.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I'm not sure.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't know.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Nope.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it. All the information should be publicly available.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Please make sure that internet access is non-discriminatory.

At best, pure entertainment media like listening to music, streaming videos, playing online and such that do not have an educational character or vocation may be made available at a charge.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating definitely limits my rights as a consumer. Let's remember that the internet was not built by ISP's but by academics and open source software practitioners who released their work to the public domain. ISP's owe the public a debt of service in return for those selfless investments and gifts.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It will obstruct innovation, education, and free speech. It will likely hamper public services.

Is there a demand for specialised services? Which services should be allowed this special treatment?

A case may be made for emergency services, but other than that, I would say not. Commercial enterprises already have a huge delivery advantage over smaller users. Additional advantages for them would so marginalize smaller users that the positive social value of the internet would be severely mitigated.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. That will make it extremely difficult for me to do business securely, and the content of my data is none of their business.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I purchase online access for a specified data rate. Any mechanism which throttles or manipulates the data rate below the rate for which I am paying is a violation of my business agreement with my ISP, regardless of whether such throttling occurs at the the originating point of transmission or at the point of receipt.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I pay for unobstructed access. I want whatever information I need to ensure that I get that.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Scott Herman

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

This is not ok to impose the end user such things as "zero rating", let us choose what we want to see.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If you continue to try impose the big corporations views on us, then the starting businesses would not be able to start on the net!

Is there a demand for specialised services? Which services should be allowed this special treatment?

None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No way! Let us chose what we want to have on our screens!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

This is a basic human right to be able to chose what we want to have on our screen!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know who is providing the connection, its speed, its quality and how is my traffic managed.  
I want to be sure this is safe to use.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Helene Vion

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Companies with enough funds would gain ultimate power over the internet, while small organisations could not survive. This would lead to a lack of diversity and, of course, free speech.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None, all services should be treated equally.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No! The ISP should have no right to spy on its clients.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all! Having an internet connection means paying for every sort of data. The ISP should not choose what the client wishes...

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Whatever information are available through the router page ( like speed) is essential. Yet, a more specific explanation of how my traffic is managed would be useful.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No, it should not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all. I should be able to throttle for my own network and/or domain as I see fit. My bandwidth should be what I pay for, nohign less, and my ISP should allow me to use it as I choose.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, traffic is traffic.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not, I pay for my internet to work at it's full potential NO MATTER WHAT service I use, that is my business. Provide me the service and I can use it legally as I like.

An ISP should protect the privacy of it's customers too.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

In absolute extreme cases, people doing extreme uploads like hosting things on home connections for long long periods of time, they can be limited to stop them, or indeed to protect against botnet DDoS attacks.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

A monthly report, showing times the internet was slowed down and where, to help identify areas of the network infrastructure are being affected, particularly slow youtube areas for example. In addition, to allow me to request compensation my service was not working properly.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Scott G

Dear Sir/Madame,

I am submitting this comment to urge you to support net neutrality which is vital to internet freedom and even political freedom. We are in a world which is increasingly controlled by large corporations with the ability to escape national controls, making them incredibly powerful. This is a real threat to the average person who has little power. But the internet is the exception - through the net he can make his voice heard. One can only imagine the consequences if his voice could be stifled through a slowing down or narrowing of his capacity to investigate, protest , reveal, express his opinion.

The telephone is an open and neutral service, but it is being greatly replaced by internet communication, which must enjoy the same status.

Respectfully,

Kathleen Lambert

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes they limit my rights as they limit economic competition and freedom of communication

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I do not see any positives. Specialised services will negatively impact the future of the internet making it less open and impartial

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All the information regarding exactly what service is being provided

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. It should be my choice what I am viewing. They would be prioritising traffic based on what serves the purpose of big business seeking more profits and power.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
anna

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

They limit my rights as an end-user by discriminating against me via the services I use the internet for.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is a threat of discrimination. Charging people differently is a violation of justice and equality.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is a violation of human rights.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
überhaupt nicht

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen

würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
J. G. Andy Rohel

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes. Commerce shouldn't dictate.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The only specialized service should be the ability to track potential terrorist usage.

Is there a demand for specialised services? Which services should be allowed this special treatment? Business and Corporations shouldn't have ANY specialized right of service over an individual user.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I pay for my Internet connection so, no interference.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Es gibt keinen Bedarf für Zero-Rating. Zero-Rating wirkt stets marktverzerrend.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Spezialdienste bei gleichzeitiger, unbedingter Netzneutralität werden den Ausbau des Internets vorantreiben. Spezialdienste ohne unbedingte Netzneutralität wird zur Monopolbildung und Marktverzerrung führen.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Nur Dienste mit Notruffunktion (z.B. VoIP) sollen diese Sonderstellung bekommen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Die Überwachung meines Internetverkehrs durch den Internet-Provider muss gesetzlich ausgeschlossen werden.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Der Internet-Provider soll nur die Datenübertragung für durch ihn selbst erbrachte Dienste beeinflussen, wenn dies für Notrufe notwendig ist (z.B. für durch ihn selbst erbrachte VoIP-Dienste mit Notruffunktion).

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Über meinen Internetanschluss möchte ich die Zusicherung, dass alle Datenpakete gleichberechtigt behandelt werden.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Dr. Johann Uhrmann

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No demand on my side

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I don't know

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't think there should be those specialized services

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The least possible and with proven technologies which does not interfere with the content

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The less possible

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Denis Van Melkebeke

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Zero Rating würde meine Rechte als Endverbraucher stark beschränken. Angenommen mein ISP führt Zero-Rating für alle Inhalte der TAZ Verlags GmbH ein. Dann würde ich doch kaum noch Inhalte des Axel Springer Verlags oder von tagesschau.de zur Kenntnis nehmen, was mein Weltbild stark beeinflussen und einschränken würde.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Positiven Einfluss hätten nur bei solchen Diensten, die bisher nicht angeboten werden können, weil "das Internet" nicht erlaubt gewisse Echtzeitanforderungen abzubilden. Ich halte es für weitaus zielführender für solche Anwendungen auch spezielle Infrastruktur aufzubauen, die die Anforderungen erfüllen. Das kann nicht die Aufgabe eines gemeinen ISP sein.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Nein, ich sehe den Bedarf in dieser Form nicht, zumindest nicht im Internet. Ich plädiere für die Schaffung zusätzlicher Infrastruktur seitens der Anbieter solcher Spezialdienste.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht! Mein ISP sollte sich lediglich dafür interessieren, welchen Teil der Bandbreite ich "verbrauche" und mir abhängig davon eine Rechnung stellen. Das wäre ja so als ob die Post für meinen neuen Roman mehr berechnen würde als für meine Steuererklärung, obwohl beide dieselbe Anzahl an Seiten haben.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese

grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No it should Not

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None at all. I should be free to watch anything I want. As long as its not breaking any rules such as child pornography and such I should be able to do what I want without being hindered in any way

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Hans Martin Eystberg

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No. No service should be treated this way.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

When there are different tiers, only the rich can get the most out of the internet. It should be more democratic than that.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for zero-rating or throttling. In fact, it is just the opposite. Consumers want to be able to do whatever they want with their internet connection.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

It shouldn't be able to do this at all. I pay for a certain amount of bandwidth or data. The ISP shouldn't be able to tell me what I can and cannot do with that.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. Only a court order and a government agency through due process should be able to monitor my traffic. Otherwise, it's not neutral.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want all of that information, and I want it up front when I'm paying for it. It should be right on the bill.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Among other things, a chilling effect on innovation and on freedom of speech and access, has no ethical upside. None.

Is there a demand for specialised services? Which services should be allowed this special treatment? Humanitarian or Emergency services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not in the least!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Perhaps a graphic presentation, such as a pie or bar chart.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I want for myself and the EU users to have free expression and the full range of Internet knowledge at their disposal, unsubjected to prioritization and restrictions of any kind on the basic functionality of the Internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

a negative impact would be to squash competition & innovation

Is there a demand for specialised services? Which services should be allowed this special treatment?  
yes, music

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I don't know all the possibilities

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know in plain English how traffic is managed on their networks, what average speed I can count on (not their optimum maximum speed) I would like to know how their mgmnt. of info is limited in time & scope.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:  
Daniel Weber

Is there a demand for specialised services? Which services should be allowed this special treatment?  
In my opinion there is no demand for special services.

I see VoIP as the only service which should be allowed (but not required) to get special technical (not commercial) treatment to ensure emergency calls even when network connections are congested.

In case special treatment of VoIP is implemented, it must not be implemented only for certain VoIP services (e.g. the VoIP service bundled with the internet access contract) but for all VoIP services.

I don't see automated driving as special service, because automated cars are also required to function within tunnels or mountain valley where low latency internet access via GSM/UMTS/LTE is not available and automated cars are not remote controlled via the internet, so they don't require low latency internet access in general.

I can only imagine negative impacts on future innovation and openness of the internet. Allowing special services without strict limitation would give big companies the chance to buy "fast lanes" which smaller companies and especially startups cannot do due to insufficient income.

Researches have shown that only few milliseconds decide if an internet service is accepted or not, so buyable fast lanes in the internet would influence the decision of the end users and discriminate other services.

In addition, special services would allow ISPs to reduce the extension of their networks because ISPs could ensure the quality of special services via traffic management while condoning the bad performance of the "rest internet".

I don't see demand for zero-rating because I don't want my internet service provider to decide for me, which internet service(s) I should use. "Zero-rating" influences end users to focus on the "free" services (which can only be offered by big and financially stable companies) and ignore the other internet services (like new startups without the necessary financial budget) and therefore again influences the decision of end users and discriminates the other not zero-rated services.

In addition, "Zero-Rating" usually occurs combined with limit data volume for other services and - as seen in the Netherlands and Slovenia

- disallowing "Zero-Rating" causes ISPs to provide higher data volume levels or a more moderate throttling after consumption of the included data volume and therefore leads to better service offers for end users.

No, ISPs should not be allowed to monitor my traffic or its content.

They should only be allowed to monitor the data amount (which does not require DPI) if the contract only includes a certain amount of data, but they must not even monitor the data amount for so-called flat-rate contracts.

My ISP should only be allowed to throttle my internet connection (not certain types of traffic) after the contractual agreed amount of data has been reached. By ISP must not be allowed to throttle or prioritise certain types of online traffic (i.e. discriminate between certain types of traffic).

I would accept a prioritisation mechanism which can be configured by myself with the "online customer service area", so that I can freely configure throttles/prioritizations on my own internet connections, as long as 1) the default setup doesn't include any prioritizations 2) I can reset to the default setup at any time 3) I am billed for prioritizations (if someone is billed).

This would ensure that prioritizations could not influence my usage/decisions (because they would be configured and maybe paid by me).

I would like to receive information about any traffic management measures (QoS, throttling, prioritisations), network address translations, interconnection/peering capacity and utilization over time, latency and packet-loss to destinations within the EU prior (!) to concluding the contract. Especially transparency on the interconnection/peering capacity would allow end users to choose ISPs with open peering policies not playing peering games like "sending party pays". BEREC should also monitor the peering situation more closely, because the current peering practices of some incumbents can be called a passive netneutrality violation. They disallow upgrades of congested interconnections to extract money from those peers sending more data (which the end users have requested).

Allowing these peering practices would lead to a blurry type of special service, where all traffic delivered via a certain interconnection is prioritized indirectly while traffic coming via other interconnections is throttled (and hence discriminated) indirectly.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Daniel Weber

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and quality, for a reasonable price. Like in other countries. More competition- now a virtual monopoly.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The specialized services will become popular and allow for centralization of ideas and content. However, that limits freedom of choice, competition, and stifles would be contributors.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
There are currently no services that require special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, what I do is my business alone. If they want information, they'll need to ask, send out an opt-in survey, etc.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All such information should be provided to the customer.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Positives kann ich nicht entdecken. Negativ wird sein, das die zusätzlich zu bezahlenden Spezialdienste immer mehr Bandbreite in Anspruch nehmen werden, so dass die normale Internetnutzung unzumutbar langsam werden wird.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Keine

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Niemals

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht, wenn die Bandbreite nicht ausreicht, müssen die Netze ausgebaut werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
BM Software Manfred Lutz

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

I belong to a small religion, and I don't want the established churches hogging the bandwidth

Kind regards,  
David R. Burwasser

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Internet access is a service that ISPs provide, delivering content to my door, just as a parcel service delivers physical packages. When I order something and it is shipped to me via FedEx, they don't get to decide "well, we don't like this type of shipment, so we're going to have it sit in our warehouse an extra week or so, to make sure all the stuff that we like better gets through first." When I order something on Ebay and they ship it via UPS, UPS doesn't get to decide "well, sure, they paid us to deliver this ... but Amazon pays us more, so we'll only deliver this AFTER all the stuff from Amazon." These things would be absurd. It is no less absurd to allow ISPs to do the same thing.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If certain services and online businesses can pay for priority content delivery, then the larger the business the more advantage they have. If two services are providing the same type of content, and one is always sloooooower than the other, most people will choose the faster service--even if it's not as good in other respects. Thus the established and already-profitable businesses have an even greater advantage over the innovators trying to break into the field than they otherwise would have.

Is there a demand for specialised services? Which services should be allowed this special treatment?

These days, internet infrastructure is robust enough that ISPs should be able to handle just about anything, and I can't think of any type of internet content that is both a) high enough priority that it deserves special treatment and b) needs huge amounts of bandwidth. I mean, things like online mental health hotlines would definitely rate preferential treatment if it were needed, but I can't think of anything they do that would require enough bandwidth to make it necessary. The services which might require greater bandwidth that I know of are things like games and movies/television--entertaining, certainly, but they function just fine now and are not any more important than, say, online shopping or chatting on message groups.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Nobody should be able to dictate what and how much legal content I consume based on their own profits.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to interfere with my internet connection at all.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Make valuable information hidden from public.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If I had to pay more for Internet services, I probably wouldn't be able to even use much of the Internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A negative impact of specialized Internet services would only encourage telecom companies to charge outrageous prices for people to use them.

Is there a demand for specialised services? Which services should be allowed this special treatment? If there really is a demand, I guess that video services should be the only ones allowed. But I want to make it clear that I am against specialization of Internet services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. To me, that would be a major violation of privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I would prefer zero interference.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The only specific information I think I'd be interested in receiving is how the speed of my connection compares to that of other providers.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Robin Garbe

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Net neutrality is important and there should be no priority to a specialised service whatsoever. As not even Oettinger could name any it is obvious that this is just a statement to make the big players in that field even more powerful.

For me Zero rating pushes me to use a certain product when using mobile internet. For example I have a contract where Spotify used to be free data and it made me automatically use this instead of other software or apps.

I don't think this should be allowed

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

NO!

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

NO DEBERÍA SER CAPAZ DE HACER NADA DE LO QUE SE MENCIONA

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

None

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Neil Freson

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

no

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

free and open communication.

Is there a demand for specialised services? Which services should be allowed this special treatment? emergency services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all of the above

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

"Zero-rating" seems like mindless clickbait.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Ultimately, moneyed interests would have undue influence on the internet, which should be highly democratic and egalitarian, just as they do in society at large.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Almost none, however specialized services for information may be important for people who are physically, intellectually, or developmentally disabled, because they might not be able to use the internet the way that the general public is able to.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Auf keinen Fall.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? gar nicht.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Sebastian Schmittner

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference whatsoever.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Peter

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

No, no, no to infinity. The US government gave internet technology to these present providers. The providers agreed to providing internet service to certain designated areas for all its customers. They have not provided this and the government has not enforced it. The internet is there to provide service to its monopolized area customers plus a small profit just like public telephone service to the population. The internet and/or telephone industry was never meant to be commercialized. It is supposed to be for the common good of the country's citizens, not to make billions of dollars for a commercial entity.

My name/organisation:

Joyce & Jerry Hansen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

No "specialized services" should be offered ever. All ISP customers have the same service for the same price not "specialized service" for those who can afford the extra money it will cost them. "Specialized services" will limit access, competition, innovation and increases the power of the ISP monopolies.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There can be NO "specialized services". If there is demand for "specialized services" they should not be considered "specialized services" but be provided to all customers of the monopoly ISP to all its customers for the same price. Without this, we would not have a free and open (not optimized) internet and lack the freedom we now have to make our own choices. "Specialized services" would bring the demise of our free /open internet, which is what happened to our free television that we used to have. Television is almost dead because of its monopolistic practices.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is NO Positive impact for ISP customers. Only a limitation of services and choice. The positive aspects of "Positive impacts" is more money, power, profits and control of customers and content for the ISP's, which would eventually lead to it's demise, just like television. Someone in the future will invent something better than the internet that is not monopolistic because the people. customers want freedom of choice and monopolies do not allow that. That is why it is so important to keep our internet open and free with no monopolies.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Commercial practices already do limit my rights as an end user. ISP's are rich, strong, powerful

monopolies that try and do make their own rules, to their benefit, not their customers. No ISP customer can compete or use their rights even now. But, the purpose of the internet is/was to enable democracy and the ability to compete with one another openly. No ISP customer can compete with an ISP, but they should be able to compete.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No government, intelligence agency (including police, FBI, NSA, etc.) or ISP should ever be allowed to read, monitor any ISP customer content or data/transmissions (for any reason). If an ISP, government agency, contractor, etc. wants access, they should be required to get a warrant from a US court (judge not fisa) after they present specific evidence such warrant is necessary and the warrant should specify the information, evidence that they specifically will be looking for. No open warrants.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

There should be NO interference allowed. All internet connections and service should be equal for all. There should never be a prioritization or de-prioritization, period. ISP's should provide excellent service to all and every customer.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, it is both limiting and discriminatory for everyone and should never be allowed!

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users? Please, provide examples.

ISP providers should provide their customers with adequate infrastructure and technical expertise so that traffic management would never be necessary. This is what ISP profit is for, to improve infrastructure and services, not to just pocket all profits.

What information would you need to make an informed decision about your Internet connection?

For example: traffic management; commercial practices or technical conditions?

Traffic management, commercial practices or technical conditions are parameters and information that should be provided to customers by the ISP, as long as they don't violate any laws or net neutrality. ISP customers and their providers should work together using best practices.

What information would you like to receive about the speed of your Internet connection?

Anything about speed (upload, download, etc.) that might help me utilize speed and maximize it.

250kb of speed is what we are stuck with, with our ISP monopoly. I've heard some have as much as 2gb for speed. Monopolies don't provide that here.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, all parameters should be defined in the contract. It should be written in easy to read and understand language and have a way to contact a "knowledgeable" customer service representative that fluently speaks your native language.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The internet and web opens doors between people to innovate and problem solve on a level not before seen by humanity. In the face of growing international concerns, like climate change, pollution control plus any number of other global issues, we must have an unimpaired open service for all to use freely.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any commercial practice that limits the exercise of individual users' rights online is counter to the original philosophy of the web and not acceptable.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All this information should be readily available to all.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I recognise video does need to have a robust and reliable stream and is data hungry so where possible this should have priority. However, data speeds will increase as technology advances so competing traffic should become less of an issue.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Kind regards,  
Graham Denman

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Es würde vermutlich so laufen wie bei Facebook. Mit Zero rating sieht man nur mehr die Inhalte der großen Anbieter, alles andere verschwindet unter einem Filter und Internetangebote von kleinen Anbietern oder Privatmeinungen haben keine Chance gefunden zu werden.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP sollen meine Internet Verbindung gar nicht beeinflussen dürfen.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Es sollte vergleichbare Standards geben bei Internet Geschwindigkeit, Up- und Downloadvolumen und Sicherheitsmaßnahmen. Nur dadurch ist gewährleistet, dass sich alle KundInnen ausreichend informieren können.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

*\*Please enter your name/organisation\**

Philipp Nowak

*\*Is there a demand for specialised services? Which services should be allowed this special treatment?\**

The Internet as it is can handle all services, there is absolutely no need to have a 'fast lane' for 'important' services. For government and medical use, which are often used as wrong examples, special lines *\*have\** to be installed, this is not normal usage. Additionally, there is high bandwidth Internet available, no need to prioritise anyone. 100 Mbit/s for example is sufficient for close to any important use case I can think of.

*\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\**

Strengthens monopolies, makes it really hard for independent and new parties to participate in competition. Companies already pay a lot for Internet connection, no need to allow individual ISPs to charge even more. There may be positive impact if bandwidth is strictly limited, which it is mostly not, but only on existing and established services with lots of financial resources and with negative impact on all other services. This reduces the openness of the Internet!

*\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\**

Assume a provider zero-rates only the services they are paid by and creates a 100MB data cap on everything else. Have fun watching videos on your friend's personal website when only big companies can pay for zero rating.

*\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\**

Metadata, but not content. Content includes HTTP headers, URLs and anything except IP addresses. Traffic should not be managed to prioritise some services.

*\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\**

They should be required to provide exactly the connection I pay for, no matter what I send through it. If my video is lagging, I will buy more bandwidth.

*\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\**

In advance to signing the contract, maximum bandwidth, mean bandwidth, bandwidth during times of high usage, latency, guaranteed uptime. Information about whether traffic is prioritised (which it should not be) and how more-paying customers get better service.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

In a word, no. There are adblocks and antiviruses. There is no need for a "zero rating" system.

Is there a demand for specialised services? Which services should be allowed this special treatment? No services should be receiving special treatment because they are affiliated with big business. I couldn't care less about how much money you're making as long as you entertain me. If you honestly think that the internet should be more like cable television, you have the right to your opinion. But consider this, wouldn't it be cool if you could watch good stuff for free, and to create things without restriction imposed by a legal team, or a writing room staff. I mean, some may like that. I'm merely suggesting that sometimes you need to create whatever you want. fanfiction, reviews, whatever, and with an open internet, you can do that.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Well, we already know that it has desensitised people to things like racism and sexism. So I won't pretend that the internet as it is now is perfect. But with an open internet creativity is allowed to flow freer than anything else has in the past. For instance, I could conjure up a pilot to a sitcom, put it up on youtube, and I have an audience. I couldn't do that with television. I propose a question. Why would you forgo the opportunity to meet new, potentially great people online, no matter how safer it might be just to have big business protect you from them? The positives of the open internet far outweigh the negatives of the internet.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would only like to know how fast it goes, how transparent it is with my information. (I'm not exactly fond of the idea that someone is watching me, it's just unnerving.) And I would want the internet to just be left alone. I don't want it demonised, but instead, embraced. Yes, it's imperfect, most things are. But there are those who fear the future, and those who are open to it, and the latter usually prospers.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They shouldn't do any kind of throttling as this would be false advertising when an ISP (say Sky) say that they have the fastest internet. When in truth, they throttle you a lot. Ideally, the internet should work like water or electricity, nobody interferences with it, just have people pay for it. Like any other public service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's should not be monitoring people without a search warrant, and even then, people who had a history of doing unsavoury things online. It's not exactly ethical for them to be given police like powers just so they could look through what I do online. What happens is my business.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't know, however it could limit my rights as an end-user!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would ultimately squeeze the little guy out, and end innovation for the new entrepreneur.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't know. Just keep everything equal.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed, and yes quality of service.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. My name/organisation:

Kurt Netzer

Is there a demand for specialised services? Which services should be allowed this special treatment?

ONLY Emergency Service Organizations and Information and News Side in case of a Disaster happening

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Can't see any positive impact for specialized services on future innovations and openness of the Internet, except the two mentioned cases above

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

'Commercial practices' = 'earnings maximization for only a few people on earth'!

Human beings are in need of free access to air, water and ANY INFORMATION provided via INTERNET and only the direct INFORMATION PROVIDER - not the 'transport instance' (e.g. 1-/2-.../n-tier ISPs) - has a right to eventually claim some money for his INFORMATION services - 'transport instances' must therefor offer a flat rate services uniformly to all human beings!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO - it shall not be allowed for ISPs to inspect or monitor traffic!

Only on an aggregated level an ISP is allowed to install and operate ONE (1) byte-counter for only out- and in-coming traffic per second on each per interface!

The byte-counter values obtained shall only be used for network design, statistics and forecasts.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

NO throttling, NO shaping and NO prioritization of out- or in-coming traffic per interface shall be allowed!

Network design must use interface statistics and forecasts to assure non-saturated interfaces.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Up- and downstream Bandwidth

Error rate

Availability

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It could, I don't know how to explain it. But the internet shouldn't be controlled by police-state.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: Freedom.

Negative: Being controlled by so-called Big Brother!

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't know.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Censoring the internet is 100% wrong, period!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Both

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Yes!

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Don't understand what this means.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is no positive except for the companies bottom line, The negative would be to slow innovation and keep the general public from using the internet without buying their services.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
none

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I just want to know that I don't want to know that I don't have to spend a fortune to use the internet,

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

No existe una demanda significativa de servicios especializados.

Ningún servicio debe tener tratamiento especial o preferencial, esta tipo de práctica proporcionaría bases para conductas anti-competitivas.

There is not a significant demand for specialised services.

No service should have special or preferential treatments, this kind of practice creates grounds for anti-competitive behaviour.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.

No.

La única demanda por servicios de zero rating es la que se crea artificialmente a través de los esfuerzos de las compañías que lo implementan, al hacer uso de esta práctica están discriminando todo tipo de tráfico que no esté cubierto, tráfico que incluye, más no se limita a: sitios o servicios de pequeñas y medianas empresas, sitios o servicios de empresas que compiten con el proveedor del servicio, sitios o servicios prestados por personas naturales.

The only demand for zero rating is the one that is artificially created by the endeavours of the companies that implement it. by using this practice, companies are discriminating against all kind of traffic that is not covered, including but not limited to: SMEs sites or services, sites or services provided by rivals of the service provider, sites or services provided by individuals.

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?

Nunca, la compañía proveedora debe (como su nombre lo indica) limitarse a su función de proveer un acceso a internet independientemente del tráfico generado por el usuario. Una analogía similar sería un proveedor de servicio telefónico restringiendo el uso de máquinas de fax.

Never, ISPs should (as their name imply) limit its functions to provide internet regardless of what kind of traffic is generated by the user. A similar analogy would be a telephone company restricting the use of fax machines.

¿Qué información te gustaría recibir respecto a tu conexión a Internet, por ejemplo sobre la velocidad, calidad de servicio o cómo se gestiona el tráfico?

Velocidad mínima y máxima tanto de subida como bajada.

Reuso de la línea (sí aplica).

Tipo de red. Ejemplo: DSL, ADSL, VDSL, HFC, FTTH.

Limite de uso de datos.

Acuerdos comerciales que el proveedor contraiga con compañías de servicios por internet. Ejemplo: Google, Facebook.

Maximum and minimum upload and download speeds.

Reuse of the line (if applicable).

Type of network e.g. DSL, ADSL, VDSL, HFC, FTTH.

Data caps.

Comercial contracts that the ISP signs with internet service companies e.g. Google, Facebook.

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?

No, Este tipo de actividad es una violación al artículo 12 de la declaración universal de los derechos humanos.

No, this kind of activity directly violates article 12 of the universal declaration of human rights

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

Si se autoriza a los proveedores de acceso a Internet a cobrar por el tratamiento preferencial, tienen un incentivo para dejar de invertir en la capacidad de red para el Internet "normal" y reducir sus límites de datos para empujar a sus clientes a utilizar cada vez más los servicios especializados. Este efecto sería perjudicial para las minorías, las personas desfavorecidas y las nuevas empresas que no pueden permitirse pagar por un acceso especial a todas las redes que les permita llegar a sus clientes, así como el desarrollo del ecosistema libre, abierto e innovador de Internet.

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las

barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

Kind regards,  
Johan Oquendo

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen

würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Rainer Bartsch

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

/

Is there a demand for specialised services? Which services should be allowed this special treatment?

/

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Definitely not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, all traffic must have the same priority!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Both.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Gregor Gorjanc

Name: Russell Winkler / LegalMatch

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No rating system allows the freedom everyone using the internet is entitled to. Allow the internet to remain a 'level playing field' for all. The commercial practices of an ISP are inherently designed to benefit the ISP financially while restricting the user's rights to free expression and freedom of communication. Access to the internet should be available without compromise for all.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

No specialized service should be able to influence overall access and freedom to use the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? A specialized, paid for service, which is accessed via the internet and is not part of the access to the internet or the ISP, does not compromise equal access to the internet. An example of a service such as Netflix or another paid for video service allows a user to pay or not pay for the service without direct impact on internet access.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All information should be available about the service I am paying for.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference. Just pay and have access.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Larisa Kai LeVeck

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

No, no, no to infinity. The US government gave internet technology to these present providers. The providers agreed to providing internet service to certain designated areas for all its customers. They have not provided this and the government has not enforced it. The internet is there to provide service to its monopolized area customers plus a small profit just like public telephone service to the population. The internet and/or telephone industry was never meant to be commercialized. It is supposed to be for the common good of the country's citizens, not to make billions of dollars for a commercial entity.

My name/organisation:

Joyce & Jerry Hansen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

No "specialized services" should be offered ever. All ISP customers have the same service for the same price not "specialized service" for those who can afford the extra money it will cost them. "Specialized services" will limit access, competition, innovation and increases the power of the ISP monopolies.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There can be NO "specialized services". If there is demand for "specialized services" they should not be considered "specialized services" but be provided to all customers of the monopoly ISP to all its customers for the same price. Without this, we would not have a free and open (not optimized) internet and lack the freedom we now have to make our own choices. "Specialized services" would bring the demise of our free /open internet, which is what happened to our free television that we used to have. Television is almost dead because of its monopolistic practices.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There is NO Positive impact for ISP customers. Only a limitation of services and choice. The positive aspects of "Positive impacts" is more money, power, profits and control of customers and content for the ISP's, which would eventually lead to it's demise, just like television. Someone in the future will invent something better than the internet that is not monopolistic because the people. customers want freedom of choice and monopolies do not allow that. That is why it is so important to keep our internet open and free with no monopolies.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Commercial practices already do limit my rights as an end user. ISP's are rich, strong, powerful

monopolies that try and do make their own rules, to their benefit, not their customers. No ISP customer can compete or use their rights even now. But, the purpose of the internet is/was to enable democracy and the ability to compete with one another openly. No ISP customer can compete with an ISP, but they should be able to compete.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No government, intelligence agency (including police, FBI, NSA, etc.) or ISP should ever be allowed to read, monitor any ISP customer content or data/transmissions (for any reason). If an ISP, government agency, contractor, etc. wants access, they should be required to get a warrant from a US court (judge not fisa) after they present specific evidence such warrant is necessary and the warrant should specify the information, evidence that they specifically will be looking for. No open warrants.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

There should be NO interference allowed. All internet connections and service should be equal for all. There should never be a prioritization or de-prioritization, period. ISP's should provide excellent service to all and every customer.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, it is both limiting and discriminatory for everyone and should never be allowed!

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users? Please, provide examples.

ISP providers should provide their customers with adequate infrastructure and technical expertise so that traffic management would never be necessary. This is what ISP profit is for, to improve infrastructure and services, not to just pocket all profits.

What information would you need to make an informed decision about your Internet connection?

For example: traffic management; commercial practices or technical conditions?

Traffic management, commercial practices or technical conditions are parameters and information that should be provided to customers by the ISP, as long as they don't violate any laws or net neutrality. ISP customers and their providers should work together using best practices.

What information would you like to receive about the speed of your Internet connection?

Anything about speed (upload, download, etc.) that might help me utilize speed and maximize it.

250kb of speed is what we are stuck with, with our ISP monopoly. I've heard some have as much as 2gb for speed. Monopolies don't provide that here.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, all parameters should be defined in the contract. It should be written in easy to read and understand language and have a way to contact a "knowledgeable" customer service representative that fluently speaks your native language.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I would have to pay more for more data because I would not be zero rated.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Special services will have an advantage .

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I am unsure.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Much information as possible, should be available .

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Manipulation des Verhaltens (unabsichtlich oder mit Vorsatz) ist nicht auszuschließen: Was "umsonst" ist, wird tendenziell mehr nachgefragt werden. Weitere Stärkung von Filterblasen. Behinderung des freien, unbeeinflussten Meinungs austauschs.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Unternehmen wie Regierungen und Behörden haben sich bezüglich Datensicherheit und Schutz der Nutzer vor Überwachung hinreichend disqualifiziert, um keine weiteren Befugnisse gestattet zu bekommen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Nur um die technische Bereitstellung zu gewährleisten bzw. unabhängig vom Nutzerverhalten zu optimieren. Einflussnahme aufgrund von ökonomischen Gründen ist abzulehnen, weil die Gefahr besteht, nicht im Sinne des Nutzers zu handeln.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen

wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Lothar Neumann

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All!

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Herman S. Simms, Jr.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Monitor yes, but no deep-packet inspection.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
It's fine if done on a traffic-type level (i.e. all video, all music, all static pages, etc.), but not if throttling traffic from a specific source.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There may be demand, but that demand is not from users. An ISP cannot know a priori how I will use the connectivity they provide. I happen to run a game server for a popular open-source virtual boardgame application (VASSAL). Were ISPs to zero-rate traffic for competing commercial game servers, our users would bear a cost they would not if they were using our competitors' game servers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Innovation on the Internet has always happened when tinkerers were free to try new things. Anything which makes that harder will slow innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? I can't think of any services which cannot be adequately handled with normal broadband capacity and routing.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. ISPs should provide connectivity. It should be up to me what I do with that.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

It can be devilishly hard to troubleshoot problems when you don't know what ports your ISP is blocking, how they're routing traffic, etc. Having this information would be very helpful.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the

potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It discourages certain types of electronic behavior while encouraging others, from specific channels. Also, it just makes the internet frustrating as shit to use.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None. Any demand is artificial when there's more than enough computational power and bandwidth/throughput to go around.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

A report of my total data usage and average speeds/ping times.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None whatsoever. Everyone knows there's more than enough bandwidth and throughput to go around.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible.

Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content

application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Justin Michael Hayden

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I should be able to easily check speed and quality of service and compare it to other services.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No to zero ratings

Is there a demand for specialised services? Which services should be allowed this special treatment? Only business wants this.No one should have special treatment on the Net.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and quality

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Open Internet rules say that ISPs can't charge websites to be in the fast lane. ISPs have created another toll, zero rating, to get around this rule, they're charging websites to be exempted from customers' data caps. Data shows that users find zero-rated content more attractive than content that counts against their caps. If web companies want to compete with websites that pay, they'll need to enrol, for a fee, in an ISPs sponsored data program. This creates a new toll for data on the Internet. Startups, small companies, and non-commercial users may face huge barriers if they can't afford to pay new tolls, and no longer have a fair shot at reaching people online. These programs also create perverse incentives for ISPs to keep data caps low. The lower the caps, the more pressure on websites to pay up. These programs ultimately hurt Internet users like me who have to pay more, for less access to the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Less access for startups and small companies. Slower internet access for end users. Whichever company, Netflix for example, pays the most, eliminates the competition by providing faster service. Great for the winner, not so much for the losers, and the rest of us who lost our choices.

Is there a demand for specialised services? Which services should be allowed this special treatment? There will always be demand for services that give an unfair advantage to the company willing to pay the most. No services should get special treatment unless they are emergency services that save lives. Anything else will leave room for cheating the system.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Never

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Hell no!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
A great deal!

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Bei Recherchen werden kommerzielle Angebote in großen Mengen als Erstes angezeigt, bevor die normalen TOP-Suchergebnisse angezeigt werden. Neutrale Informationssuche oder Anbieterrecherche ist erschwert bzw. werden inzwischen kaum noch angezeigt. Inzwischen bin ich so gefrustet, dass ich die Werbeanzeigen überlese, danach die TOP-Homepages überfliege bis ich dann 1-2 neutrale Informationen finde. Der Informationsgehalt ist recht gering und es macht immer mehr den Eindruck, dass es neben den bezahlten Anzeigen und den TOP-Homepages nichts mehr gäbe

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Gezielte Beeinflussung der Bevölkerung in politischer/ gesellschaftlicher Meinung und Kaufentscheidung

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Definitiv NEIN

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Definitiv GAR NICHT

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit. Freier Informationszugang

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen

ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Kathrin Lietz

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Does not sound correct and fair to me.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
jimmywise

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There are already ways in which ISPs can charge you for certain services or track you when you attempt to learn about other ISPs. If a representative of an ISP tells you "we don't want to discourage any particular usage of content, media, and/or other online services" then they are lying to you for the sake of protecting their stocks, shares, and interests. The practices already in place already influence me to find the methods of viewing content, media, and other online services that will bring me the least trouble (including tracking and sending my data to companies that, despite my wish for my data to remain completely inaccessible, will be sold anyway for any sum.)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The more that a company throttles, sells their user's data, takes things that do not belong to them, the more that products from major name-brand companies will make their way into peoples' homes, ones that will continue to sell every scrap of identity to others in order to make peoples' very brains sources of income without our say-so. We are not property. We do not deserve to be treated like cattle, we do not deserve for our ideas and desires to be expressed to anyone without our permission.

However, when there are services that openly list (without limitations) various products and services that, with no bearing or association with ISPs, developers, or sponsors, with complete details on everything about that product without withholding information or voluntary usage statistics (reviews, technical difficulties,) will make for a greater and more free market.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Traffic should never be monitored on an ISP's network unless automatic systems that catch illegal activities are employed--and they should not collect any other types of data except those that notify the systems that illegal activities are occurring.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. The fact that internet prices are so high already (unnecessarily) shows that there is an inherent greed in ISP companies that needs to be whittled to a (still) profitable but non-aggressive system. In this way, it will demotivate companies from throttling and disabling internet for people who depend on the internet to live their life or rely on it for their only source of entertainment.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

- Is my internet service going to be/being throttled in any way, shape, or form at any time?
- What is the TRUE speed of my download and upload?
- What is done about information regarding the traffic I give websites?

- What services have access to my information, internet usage, and search history, without my permission?
- Will my traffic, information, internet usage, search history, or any other information (without permission given) ever be monetized? Will it if I do give permission, despite desires expressed to keep it anonymous?
- Is the hardware provided to me able to access and/or provide all of my download/upload speed?
- Are there intentions to throttle my or others' internet speed now or in the future?

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole. Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Devin Lafferty

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Melinda Schneider

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I believe that these practices would most likely lead to limitation of rights (based entirely of past corporate motivations & practices), but I do not have an exact example at the moment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, Absolutely Not!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Minimal; 5% at most.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Michael Lauren DeSarbe

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no demand for so called "commercial practices" because they will limit my rights as end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The negative impacts will be less freedom of communication, less competition and less innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? I don't see any demand for such so called "specialised services", so there aren't any service that should be allowed this special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

¿Existe una demanda de "prácticas comerciales", tales como el Zero rating? ¿Limitarían éstas tus derechos como usuario final? Por favor, proporciona ejemplos si es posible.  
si

¿Existe una demanda de servicios especializados? ¿A qué servicios se les debería permitir este tratamiento especial?

A ninguno

¿Debe permitirse a los proveedores de acceso a internet monitorizar tu tráfico, incluyendo su contenido (por ejemplo, mediante la inspección profunda de paquetes) para llevar a cabo la gestión del tráfico?  
no

¿Cuánto debería ser capaz tu proveedor de Internet de interferir en tu conexión a Internet - por ejemplo, para ralentizar o priorizar determinados tipos de tráfico online (vídeo, P2P, etc.)?  
nada

¿Qué información te gustaría recibir respecto a tu conexión a Internet, por ejemplo sobre la velocidad, calidad de servicio o cómo se gestiona el tráfico?  
velocidad, calidad de servicio y cómo se gestiona el tráfico

La transparencia no puede, según lo propuesto por la Comisión en su proyecto inicial del Reglamento y posteriormente rechazado, ser considerada un antídoto para los comportamientos anti-competitivos por sí sola. La transparencia tiene un alcance limitado en la solución de problemas, sobre todo en este contexto.

La diversidad y la capacidad innovadora del ecosistema de Internet se basan en su bajo coste para la innovación y bajas barreras de entrada al mercado. Estos principios aseguran desde el primer día que toda empresa, start-up o servicio no comercial - sin importar su humilde tamaño o financiación - tenga el potencial de alcanzar una audiencia global de igual manera que sus competidores. Esta fuerza impulsora para la prosperidad y la diversidad de la economía online sólo puede asegurarse con un Internet abierto, neutral y no discriminatorio. Si se permite que los proveedores de Internet puedan interferir en las decisiones de sus clientes, mediante la discriminación económica o técnica, se pierde esta libertad esencial. De acuerdo con la consideración (1) del Reglamento sobre la neutralidad de la red, la legislación ha de ser interpretada a la luz de estos objetivos.

La discriminación económica (Zero rating) interfiere en mi derecho, en virtud del artículo 3(1), de acceder y en particular de distribuir información libremente. Si un proveedor de Internet discrimina entre proveedores de contenidos, aplicaciones y servicios haciéndolos desigualmente accesibles a través de su servicio de acceso a Internet está constituyendo una injerencia arbitraria en la esencia de mis derechos. Por otra parte, esta práctica restringe mis derechos en virtud de la Carta de los

Derechos Fundamentales (artículos 11, 15(2), y 16). Por lo tanto, la discriminación económica no debe permitirse bajo las directrices del BEREC.

El Reglamento contiene normas muy claras sobre lo que constituye una gestión razonable del tráfico. De acuerdo con el artículo 3(3), toda la gestión del tráfico se debe hacer de manera agnóstica respecto a las aplicaciones, si es posible. La gestión del tráfico según la clase perjudica a la competencia; supone el peligro de dañar involuntariamente a aplicaciones específicas; puede discriminar el tráfico cifrado; crea incertidumbre para los proveedores de aplicaciones de contenidos y de servicios; frena la innovación; puede dañar a los usuarios individuales, y puede crear una sobrecarga regulatoria. Por lo tanto, la aplicación de la gestión del tráfico según la clase en situaciones en las que la gestión del tráfico agnóstica bastaría es innecesaria, desproporcionada, intransparente para el usuario y discriminatoria.

El Reglamento permite la existencia de servicios especializados únicamente bajo estrictas condiciones y garantías. El artículo 3(5) y la consideración 16 requieren que la optimización de los servicios especializados sea objetivamente necesaria para la funcionalidad de características clave de servicio. Este no puede ser el caso de servicios capaces también de funcionar en el Internet abierto, de entrega al mejor esfuerzo (best effort). Por otra parte, la consideración 16 impide que los servicios especializados sean utilizados como elusión de las normas sobre neutralidad de la red para la gestión del tráfico. Cualquier desviación de estas garantías de seguridad para ampliar la aplicabilidad del concepto de servicios especializados causaría inevitablemente un aumento de las barreras de entrada al mercado y por lo tanto debilitaría el potencial innovador de Internet en su conjunto.

Kind regards,  
Isaac

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

These could limit my rights

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I want a free and open internet

Is there a demand for specialised services? Which services should be allowed this special treatment?

No specialized services

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I live in Pasadena CA. The internet speed is awful sl 00000 w

I think everybody, everywhere should have extremely fast internet

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No!

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Among other things, a chilling effect on innovation and on freedom of speech and access, has no ethical upside. None.

Is there a demand for specialised services? Which services should be allowed this special treatment? Humanitarian or Emergency services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not in the least!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Perhaps a graphic presentation, such as a pie or bar chart.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Gary Gregerson/SEIU Local 1021

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

As long as someone pays for Internet access, they should have free rein to visit any legal site they want without limitations. Specialised services would only have a negative impact on this.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None at all as far as I'm concerned.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, that is an invasion of privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. Throttling to give preferential treatment for certain websites should be illegal.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Matt Ezero

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating, caps, throttling and such practices lesson the quality of the end user experience. I may not be able to use the site of my choice to access the information or content that I need to accomplish my objectives. If speed must be slowed, it should be slowed equally for all content.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

In a tiered internet system some content providers will inevitably be slighted although their product may be of high quality, and the end user may never know it.

Is there a demand for specialised services? Which services should be allowed this special treatment? I am unwilling to consider this "slippery slope."

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. It is very invasive, and traffic management is wrong in se.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Every packet should be treated equally.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I believe that all pertinent information should be available to the end user, a paying customer so that they may make informed choices about their provider and the site that they are accessing. Search engines also need to be transparent about how sites are chosen and ranked.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes, it can tip the scales in favor of the ISP's own services, reducing competition and limiting the rights of the end user by essentially forcing them to use their service or suffer the consequences.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It would stifle competition across the entire web, which would in turn cause many other markets to stagnate as the highest bidder can simply pay to have their services prioritized, preventing other businesses from taking off, or even stopping all the competition outright.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't believe that there's any reason for specialised services to be in demand, not is there any demand for them by consumers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know just what is being seen by my ISP, and how/if/what is being throttled by them.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not! What I do online is my business, not theirs.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir or Madam,

Please take this comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no inherent demand for such practices, any apparent demand is induced by the introduction of such discriminatory practices. These would limit my ability to be a productive scholar and my ability to engage in collaborative scholarly activity with those from countries where these practices become common.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While it would be difficult to list any absolute positive or negative impacts as this is highly service type dependent, if services were prioritized by type, there could be a greater efficiency for usage, however any preference based upon economic status of the service plan would severely limit the ability of open academic collaboration and the progress of scientific advances.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not! ISP should be dedicated from maintaining the integrity of privacy, including within their own institutions.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

This should only be justifiable when data usage is presently (not potentially) interfering with connections of other users without regard to type of service package purchased or when necessitated for public emergency situations.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

In order to foster a healthy, competitive and innovative market, transparency of what the individual user has purchased (that is readily accessible) is essential. I personally would like to know my connection details as well as know how they compare to what I've agreed to purchase and the connections of current users of the system.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Mike Seyfried

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Es würde zu einem 2 Klassen Internet führen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Nur Lebensnotwendige Dienste.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Definitiv nicht!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Up- und Downraten, wer die Daten auswerten darf, wer eine Kopie der Daten erhält (BND), Traffic Management.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen.

Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely Not.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Zero Interference.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,  
Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no consumer demand for practices such as zero rating. These only serve to limit fair competition and ultimately consumer choice.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No, none.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There can be no positive impacts for consumers. Specialized services serve only to stifle competition by setting an uneven playing field.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed, bit rate, latency.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

We pay for a service. ISPs should not be able to selectively degrade that service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, ISPs should respect our privacy.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services will restrict both access and speed of the Internet to the mass of individual users.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
As long as access by all is not adversely affected there could be no limitations on services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and quality

Kind regards,

TJ Brooks

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Neg: restrictions on access

Pos: none for me and the concept of open access

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Not sure but would not bode well for the future of open access

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of that plus assurances that I am not and will not be restricted or throttled. also would like the government access be restricted to court supervised subpoena.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, and yes.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No, and none.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Anything that I want to view.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, a zero rating can however influence which apps/services I use on my mobile device. This is relevant because when I am traveling using GPS and route planning software I can get close to my monthly mobile data limit and as such would almost be forced to use zero-rating apps/software or services to not exceed my data cap resulting in fines. This was previously not an issue when unlimited internet was readily available on mobile devices in the early 2000s.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

A potential positive of specialized services is that it could allow a 3rd party company to subsidize ISP network improvements without additional cost to the consumer. However, this is more likely to have the negative consequence of an ISP charging both the 3rd party company, i.e. Netflix, for a premium lane, but also still raising rates for the consumer citing the self-same network improvement costs in both cases. This is also disingenuous to the ISP's shareholders as it allows for arbitrary inflation of earnings which could evaporate if competition increases as the pricing would not actually cost determined.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No. It would be better for all services to be equally upgraded by network infrastructure improvements rather than site specific optimizations with no accompanying network infrastructure improvements that would tend to be favored by a specialized services approach.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to see a daily average upload and download speed with standard deviation to the top 5 most visited sites by users of the ISP. I would also like to see the daily average with standard deviation of the percent of packages dropped. Furthermore, I would like to see peak internet usage times by the ISP so that large downloads can be timed to off peak hours reducing ISP network loads and which types of traffic are prioritized based on time of day.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, an ISP should not be allowed to monitor traffic beyond records of where the traffic is coming from and where it is going. This specific provision is allow for traffic optimization and determining where interconnection speeds should be improved and not for person tracking.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

An ISP should not be able to prioritize internet traffic beyond ensuring that each subscriber currently using the service obtains bandwidth commiserate with the subscribers internet package.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

As mentioned before: ISP's should not be allowed to discriminate against their customers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialized services are just a way to punish the average user for not being able to afford them.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not. It is not the ISP's business or right to spy on their customers.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be allowed to discriminate against their customers based on what type of traffic they generate. Period

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed Over Time and Your Speed vs. Average Speed would be useful.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Paul Pierot

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero Rating führt zu Bevorzugung einzelner Zahlungskräftiger Dienste oder Anbieter. Ich möchte nicht das bei der Telekom nur Spotify bevorzugt wird.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Keine Sonderstellung für Spezialdienste! Schnelles Internet für alle Dienste!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Bitte keine Beeinflussung.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Geschwindigkeit, Quality-of-Service und Traffic-Management

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Holger Hänisch

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Wer eh ein scheiß langsames Netz hat, braucht nicht obendrein noch irgendwelche Bremsen. Alleine gute Bilder benötigen heute eine guten Übertragungsleitung. Im Jahr 2016 kann es nicht sein, dass Downloads, verschlüsselte Übertragungen und sonstiger Internetverkehr, für sogenannte "Premiumdienste" begrenzt wird, einfach viel viel mehr superschnelle Netzleitungen schalten!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Jedwede Regulierung von Spezialdiensten, die ihrerseits eine diskriminierende Fast-Lane für Angebote einrichten würden, die normalerweise auf dem Offenen Internet erreichbar sind, muss vermieden werden, um die Freiheit der Kommunikation, des Wettbewerbs und der Innovation zu erhalten.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? never ever, mehr schnelle Leitungen!

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Never ever

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Never ever

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Alle!!! Informationen öffentlich bereitstellen

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

agree

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NO

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It's driven by greedy corporations. They do not want spend money to build out their infrastructure to provide desperately needed improvement in capacity. Instead, they want to milk the current highly inadequate infrastructure for maximum profit with minimum service.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The internet is the last frontier of free speech.

Is there a demand for specialised services? Which services should be allowed this special treatment? Perhaps health and emergency services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not, especially with a fascist trying to become President of the United States. The secret police he would create almost immediately would just love that!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. It should function as a common carrier.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above. Corporate greed thrives on secrecy.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Kind regards,  
Fr. Stewart Wilber

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Dr. Alexander Sarras (Physicist)

Is there a demand for specialised services? Which services should be allowed this special treatment?

To (re-)categorise ANY kind of EMERGENCY service as "specialised" would probably make sense, beyond that nothing does ....

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

New monopolies, even "stealing" of intellectual property rights, by those capable of submitting (intercepted) data faster than the real inventor, etc...

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not so much a demand as a dumb-mand ... The revenue to finance the bandwidth used has to be generated somewhere. So to be a success in terms of commerce, the end-user has to be deprived of his possibility to choose other products .... go figure!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

definitely NO!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Non at all. I pay for a certain amount of bandwidth, even if I don't use it all at a certain moment in time, it's not my ISPs prerogative to redistribute an already paid for service to someone else. For the usage of "my" bandwidth I have the responsibility and knowledge on what to prioritise at what time!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Obviously speed and QoS, information such as round-trip time or similar at request. Immediate information if lagging or interruptions occur. BTW Speed is not a mean over time!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where

application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

If there is a demand for commercial practices they should be ignored for the greater good.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Innovation would slow down as fewer people would feel the urge to contribute when commercial interests would be the main beneficiaries of innovations.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

yes, these definitely would limit my rights as an end-user.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

never!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not ever be allowed to interfere with anyone's connection.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive info about everything related to my internet connection.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Dienste die niedrige Latenzen benötigen Streaming, VOIP, Gaming, Monitoring, etc.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Wenn man von vornherein eine Technologie auf bestehendes beschränkt, verstümmelt man sie damit und erstickt innovative Ideen und Experimente im Keim.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Meine Daten gehören mir. Solange ich nicht festlegen kann wer welche Inhalte sehen darf und kann, gehen selbige niemanden etwas an außer mich und ggf. meine/n Kommunikationspartner

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte alles wissen. Ich möchte wissen welcher Traffic gefiltert wird, welches Gateway welche Pakete wie behandelt und warum.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Ein Provider stellt eine Leitung zur Verfügung. Welche Dienste wie darauf laufen dürfen sollten nicht reguliert werden. Das verhindert Innovation (bspw. das Ausprobieren neuer Technologien, die der Provider noch nicht bedacht hat).

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Sven Rütz

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Kostenloser Zugang zu Informationsseiten (Wikipedia). Allerdings wäre das die Verstärkung von Monopolen. Wenn es eine/ mehre Alternativen gäbe, würde ich sie nur mit Extrakosten nutzen können.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Einen Vorteil sehe ich nur bei Lebenswichtigen Übertragungen. Also Live-Operationen und Daten für Notdienste. Hier sollte man aber einfach extra Bandbreite schaffen, wie es in skandinavischen Ländern üblich ist. In allen anderen Bereichen wird wieder nur die Monopolbildung unterstützt und neue, innovative Dienste ausgebremst.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Vielleicht Live-Operationen und Daten für Notdienste. Hier sollte man aber einfach extra Bandbreite schaffen, wie es in skandinavischen Ländern üblich ist.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Meine Daten gehören mir.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Gar nicht. Welche Dienste ich wie schnell nutzen will, sollte nur ich entscheiden dürfen.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? ich möchte die echte Geschwindigkeit wissen. Dann Ping\_zeiten und ob meine Daten untersucht, verändert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? I think the rationalization is for maximizing profit not for providing real choice to the consumer. I've been through this type of training and they try to train you to tell customers they have a choice when they don't. To tell people they can pay less but have less access isn't a choice when there is increasing financial inequality in the world. Additionally, I appalled that the cost for them remains the same after upgrading their infrastructure yet they come up with the concept of different costs to the consumer. It seems like a gigantic scam. Businesses that don't realistically factor in the cost of doing business, which should include a living wage and benefits, shouldn't be in business or they need to scale their business back. I think the entire world has gotten greedy to the point of poisoning the planet and making wage serfs out of people and censoring freedom of information, speech, and thought.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I'm in favor of an open Internet especially for information purposes when commercial media is already censoring news and has manipulated an entire election in the United States.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating can be utilized to discriminate against certain businesses or prioritize others. I believe it is a limitation on rights as an internet end-user. Tremendous opportunity to manipulate the public.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Never

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I'd like the concept of not always getting less so the 1% can get more be something that is instituted. So information on speed/quality of service or management of traffic would help to prove that is happening I'm all for receiving that information.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by

economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Christine DeCarlo

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

My name/organisation:

Eric Paul Jacobsen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

It is crucial that services that could be offered on the open, competitive internet are not re-categorised as "specialised services" for anti-competitive reasons.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Specialised services should must not include regular content and applications readily available - or capable of being made readily available - across the Internet. It is especially important that content and applications that are available over the Internet access service are not recategorised - as this would result in the exact opposite of net neutrality.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Any commercial practices which limit users' rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation. The Regulation aims to safeguard open internet access; commercial practices therefore cannot restrict free choice by prioritising a service or application over another. If a commercial practice creates disadvantageous conditions then it is not only a violation of user rights, but also of the core principles of economic competition.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Practices such as deep packet inspection (DPI) undermine your right to privacy and go against EU

data protection and privacy rules. In fact, some experts argue that DPI is an invasive surveillance and censorship technology.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

The Regulation says that the objective of reasonable traffic management is to contribute to an "efficient use of network resources and to an optimisation of overall transmission quality", without the use of commercial criteria. If not properly clarified by regulators, providers could use this potential loophole to apply disguised commercial criteria to arbitrarily classify certain categories of traffic, in order to prioritise one category over another. This discrimination would undermine net neutrality, to the detriment of free speech, innovation and openness.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Reasonable Traffic management should not impede user choice. Quality and speed should remain consistent regardless of the type of content being accessed. ISPs cannot manage traffic in a way which would block, alter, slow or throttle access to any specific application, service or content. In short, discrimination should not be allowed.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users? Please, provide examples.

If companies interfere and restrict or limit access to specific points on the Internet, this will have an obvious impact on our freedom of choice and access to information. The Regulation clearly states that traffic management must be reasonable and only last as long as necessary. If congestion is sudden and temporary, traffic management can take place, but it must remain application-agnostic. If congestion is recurring, the operator should enhance its network capacity and must not rely on this exception.

What information would you need to make an informed decision about your Internet connection? For example: traffic management; commercial practices or technical conditions?

BEREC should require ISPs to use a common terminology in order to foster transparency about how traffic on their networks is managed. Your ISP should tell you concrete examples on how it manages traffic and provide information about how their traffic management practices are limited in time and scope and executed on a necessary and proportionate basis. Technical or legal jargon used in contracts must be avoided to ensure clarity. However, discriminatory behaviour does not become less discriminatory simply because the provider is "transparent" about it in the consumer contract. Transparency is only one of the criteria needed to ensure that you enjoy an unfettered access to the internet and you are not misled by your ISP.

What information would you like to receive about the speed of your Internet connection?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Eric Paul Jacobsen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, the only demand for zero-rating is from companies who want to block the competition by having their services zero-rated rather than compete fairly in the marketplace.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No, I have not heard of any demand for this. This basically sounds like "fast lanes" hiding behind a fancy name, it basically sounds like "Well, fast lanes are now legal as long as these do not cause slow lanes", which is an oxymoron made up by politicians trying to make "compromises" between freedom and corporatism.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This would lead to slow lanes - I have as much right as any other customer to blast as much content up and down the pipes as my connection will handle, regardless of what that data is, and saying "Oh, but if we slightly limit this and this and this, we can improve this and this without actually upgrading our infrastructure" is a very slippery slope indeed.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all, see previous question. This is asking for slow lanes, and is therefore a very bad idea.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you

should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Robert Markovski

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Romedius Weiss

The Router should be under user control and allow such settings for the user. The ISP should only be allowed to limit the general throughput .

Up and down Link speed, policing methods

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I cannot think of any demand for these measures from a consumer point of view. It only helps ISPs.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I don't see any positive impact of specialized services. It will hamper other, similar services and make innovation hard, if not impossible because newcomers will not have a fair market.

Is there a demand for specialised services? Which services should be allowed this special treatment?

No there is no demand. It works now, why would it not work in the future?

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The real speed, not the theoretical one. Information about which services or sites are specially handled, if any.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all. I paid for it after all.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Obviously no. It's an invasion of privacy and I pay for bandwidth that I want to use as I wish.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any/all internet users should have the EXACT same rights and privileges.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If ISPs want to provide faster internet "lanes" without any negative consequences upon those that do not pay to be "fast lane" users that would be totally fine.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
UNKN

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Yes, I would like to know as many aspects as possible about paid Internet service, such as speed, quality, and traffic management.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

There should be no "traffic management" by ISPs.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Absolutely NONE!!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see few positive impacts, negative impacts would include the stifling of innovation and the loss of business to smaller organizations, as well as a chilling effect on free speech.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No services deserve special treatment, excepting MAYBE specific emergency and government-related functions.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
As little as possible.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
All of the listed datapoints would be things I'd like to see.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific

applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
robert gerosa

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No demand

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Not at all

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities,

disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

---

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Kommerzielle Praktiken benachteiligen bestimmte Inhalte. Das widerspricht dem Grundsatz der Gleichbehandlung der Daten hinsichtlich der Art bzw. Geschwindigkeit der Übertragung.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, die Privatsphäre muss geschützt werden.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
In keinsten Weise. Es müssen alle Daten hinsichtlich Übertragung gleich behandelt werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

mit freundlichen Grüßen,  
Jens Brandt

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, monitoring is an invasion of privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The internet should be treated as a public utility - companies should not be able to control your usage arbitrarily based on their set of rules.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they

may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Peter Mayr

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

I don't see any necessity for special treatment if services.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Special services could stifle innovation, e.g. a video start up finds it harder to enter a market where another competitor has already bought a "fast lane" from providers

\*Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

This could lead to unfair competition (e.g. one music streaming provider has an agreement with a certain telco provider and therefor an advantage)

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

No.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

The ISP should just provide the infrastructure but not interfere with the traffic

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

All of the above

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

only by the various ISPs for their own services. they limit every users rights and restrict all traffic except what the ISP deems it wants to allow.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

positive only to the ISP that uses it. negative to all innovation and services other than those of the specific ISP

Is there a demand for specialised services? Which services should be allowed this special treatment?  
i dont think so and no service should get specialised treatment

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NOT AT ALL

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

all 3, particularly with the traffic management. there is no need for that at all! it is only a way to allow the ISP to slow traffic down. it does nothing at all to increase the speed of other users.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context. Please remember, the Internet is the best communications medium invented so far. It should never be used just for advertising and it should never be monitored for usage by ordinary users. If there is a genuine suspect, then properly targeted surveillance may be necessary, but not always, even in these circumstances

Kind regards,  
kev clarke

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I think there is a demand for these kind of "commercial practices" from the already established publishers and web services on the Internet, because it would make it harder for newcomers to compete since they have less negotiation power with the ISP. A startup-company that provides its services over the internet would immediately be at a disadvantage to other already existing corporations that have a "zero-rating contract" with most of the ISPs. On top of that, zero-rating puts an ISP in a powerful position to enforce a policy of what you could coin economic censorship. I hope I don't have to explain how this limits the rights of the end users. As a comparison: a library doesn't charge more to access a certain book compared to another just because it was published by a different publisher.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There could be a positive impact on future innovations because it allows for methods to provide Quality of Service (QoS) for various time critical services such as Voice over IP (VoIP), gaming and other entertainment, while still maintaining decent connectivity for other users accessing regular webpages. This could benefit all the users of an ISP. There could however be a negative impact on the openness of the Internet when these possibilities are used to provide additional qualities to these kind of services, selective of the corporations that are providing the service. This would make it harder for end-users to consult certain types of content and would therefore have a negative impact on consumers' rights.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I think that from an engineering perspective there is a demand for specialized services because certain services require more resources from the network such as VoIP, video conferencing, online gaming... than other services such as regular web browsing. From that perspective it makes sense to have specialized services for real time services such as VoIP, video conferencing and online gaming.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, various transport protocols such as TCP have been designed to manage the traffic and avoid network congestion. Although these protocols aren't necessary flawless, I'd rather not have ISPs providing an "improved" service by monitoring my traffic. Not even looking at the headers of the various protocols (metadata on the content) apart from what is necessary to route the packet through the network (not manage the traffic!), since this possibly already reveals a lot of information about what the user is doing such as what web page the user is looking at, which application(s) the user is using, ...

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I think that the ISP should not interfere at all depending on the types of online traffic. They could however develop routers to be put in homes/offices and used as gateways to the Internet with the possibility of configuring them to provide these kind of services. As such the throttling or prioritizing happens before the traffic enters the network of the ISP and the user can decide for him/herself how this should be done. These routers could be preconfigured with the policies of the ISP. One final note: make it user friendly please...

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The average available upload and download speed on various times throughout the day. The percentage of time the network is down. Whether you get a fixed or dynamic IP-address assigned. What traffic is prioritized and in which order. An easily understandable version of the quality of service in order to get an overview of what you can expect. What kind of packet inspection is being done. What information about my traffic is being stored and for how long.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Thomas Dejonghe

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Paula Stibbe

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero-rating practices ultimately only helps big players to stay big and keeps small players small. This regulation is not helpful if you want innovation on a society level.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Higher prices for unfiltered internet access. Partitioning of the internet (disconnecting certain groups from certain parts of the net).

Is there a demand for specialised services? Which services should be allowed this special treatment? From the consumers perspective there are only disadvantages for specialized services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Under no circumstances the ISP should be allowed to look into the traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP should treat all traffic equal (best effort).

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I wish there would be no need to know anything one's Internet connection. It should always be unfiltered, neutral and as fast as possible.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. ---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

My monthly fees are based on the ongoing cost of network upgrades. Zero rating is always a "perk" to a premium service that congests the network paid for in a larger percentage by base users. This is unfair and anticompetitive.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The appeal and power of the Internet is its openness. Anything short of that is destroying what is and what will be, however enticing it may appear in the short term.

Is there a demand for specialised services? Which services should be allowed this special treatment? None whatsoever.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Absolutely not! If realtime services like VoIP are suffering, upgrade the network! This is 2016, not 1996.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Absolutely none at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed. Network congestion (in percent of total capacity). Traffic should never be managed besides dropping packets when routers are overloaded, treating all packets equally.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

zero-rating is just another process whereby certain types of traffic get preferred treatment. It should be banned.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Let customers do whatever they want and stay out of trying to control what they may and may not send. Do not try to mess with this basic free and fair approach. You'll only interfere with the natural growth of the internet to a medium which serves customers like me in the way they wish to be served. It's really not that difficult.

Is there a demand for specialised services? Which services should be allowed this special treatment? Please save us from "specialised services" which will always be abused to become hidden ways for service providers to squeeze more and more money out of customers like me.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should have absolutely no control over the content of messages that I send.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Speed and response time are significant, But, if "quality of service" are fancy words to describe tricks which allow some customers to get preferred treatment while others suffer, I'm against all of them.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
I do not believe that there is a demand for specialised services. If any services should be allowed special treatment, it would be those with the highest use. But not at the expense of slowing down other less popular sites.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

To my understanding, this is an invasion of privacy. Unless the goal is organisation and speed, I do not agree that my traffic should be inspected.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

My ISP should not be able to prioritise my online traffic. All websites should be equal, anything less is a restriction of Internet freedom.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

100% of my speed, quality of service and traffic management should be available to me at any time. When I pay my Internet service provider, I expect full freedom and disclosure of this information.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is an obvious privacy violation. And every single bit should be relayed the exact same way.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Jean-Yves Toumit

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:  
Christopher Müller

Companies only want to make money. There is no other reason ...

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Reinis S

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There's a demand, yes, but they also inevitably mean that, to recoup the loss of "zero-rating" something, they throttle the total data cap elsewhere. If you must allow zero-rating, allow it by filetypes rather than by companies or businesses. Don't zero-rate Netflix, zero-rate videos, for example. Much more expensive, but not anywhere near as liable for abuse. And they don't HAVE to have zero-rating policies anyway.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Basically, we'd have internet monopolies. It'd stop being a place where some random guy could make a startup, and start being the place where the companies in power stay in power and consolidate it, and there's no innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

I don't think there's anything that objectively needs a faster speed. If you're going to do it for a video, why limit it to just that, when, short of downloading a large file, nothing else is particularly big?

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Definitely not. There are legitimate reasons to monitor traffic (statistical analysis, in certain cases security, though that one's the government's purview, and this should be done as anonymously as possible), but traffic management is not one of them.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

I think they should only be able to interfere by repairing damaged lines, basically. If the internet goes down, interference is fine to bring it back up, but everything should be at the same speed. Not filetypes, not websites, not companies should be criteria to discriminate. Smaller filetypes will not use as much because they're smaller, so that's fine.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

The actual speed I can expect to get in daily use, rather than the (seemingly) entirely unrelated speeds they advertise at.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
More innovation

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Yes! All services!

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Never

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

They would steer me to use the preferred application, by giving some services competitive advantages.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

People would not try new things, since they are priced out, and the access to them are slow when they perform traffic shaping. So you would end up with monopoly situations on the Internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? Governmental services, to give people access to the government's services. NOT governmental inter-services, or controlling possibilities.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Traffic shaping done on my traffic

Speed

Quality

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

no

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

none

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

It creates a bias for a particular service, like one of the movie streaming services that I can think of, and therefore potential to create a prioritised, 'monopoly' for some services

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No way!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None!

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. "Kommerzielle Praktiken" wie z.B. das ZERO Rating werden meine Arbeitsmöglichkeiten als Freiberuflich Selbstständige extrem benachteiligen gegenüber denen großer Firmen !!! Der Mittelstand in Deutschland und Europa ist sowie durch vielfältige Gesetzgebung extrem benachteiligt und darum mehr und mehr am aussterben. Das ist sehr ungerecht, fördert immer wieder die eh schon Großen und ist gefährlich für unsere Demokratie !

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
da kenne ich mich nicht aus

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
weiß ich nicht

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
gar nicht

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Alle zugänglichen

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass

Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Anne-Careen Engel

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No, I am not aware of any examples.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I am not aware of any substantial positive arguments for specialised services on the Internet. Currently we are not aware of any service that needs that kind of exaggerated speedboost on cost of other internet users. To spin it really far: At some point we will connect our brains to the internet. For live-information-exchange and processing a big bandwidth will be needed in addition to a fail-proof and lag-free connection. This kind of fail-proof network could get a higher priority over other traffic. On the otherside ISPs should get into the need, to build these kind of fail-proof networks by investing in the overall infrastructure - they will not invest that much in the overall infrastructure however, if they just could sell the existing bandwidth for an even higher profit.

Additionally specialised services will shrink the overall market, with a lower chance for competitive start-ups to succeed versus established specialised services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be able to interfere with my internet connection. Internet connection could be treated as an basic human right for living. To take one of these rights away, should need confirmation of a judge in any case.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every

enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Just a way to charge more.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Gbit cost.

Is there a demand for specialised services? Which services should be allowed this special treatment? If there all fast what's the point.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No-now quit being greedy !

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None I pay for my data.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Billy Lansdell

Sehr geehrte Damen und Herren,  
Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen. Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Thomas F. Schmitt

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

For sure!

I don't want to need to think about which services I use how often, why should this be necessary?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It can be misused. Who decides which traffic is "better" and which not? It will depend on who pays the most for sure which will not be fair at all....

Is there a demand for specialised services? Which services should be allowed this special treatment?

For sure. I think each big company would like to gain advantage of fast lanes...

I can't think of any service which is really in need of this service.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, not without permission by a judge in case of criminal activity.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No throttling at all....

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

It would be good to be able to check these parameters online.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich möchte nicht an einen Anbieter eines Dienstes, z.B. Streaming oder E-Mail, gebunden sein, oder dass mein Provider das für mich entscheidet.

Gerade im mobilen Bereich sind Kontingente klein, da wäre zero Rating ein unfairer Wettbewerbsvorteil.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Sie werden zu einer weitergehenden Konzentration und Monopolisierung führen, so dass es pro Dienst nur noch einen Anbieter geben wird.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Interessant wären Sonderkanäle, um Störungen melden zu können, oder um in Krisensituationen Bandbreite für Information und Koordination zu haben, ähnlich wie Priorisierung bei GSM-R.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, er soll die Daten nur weiterleiten.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? QoS könnte sinnvoll sein, aber nur nach Datentyp (Streaming) und nicht nach Anbieter. Am besten manuell einstellbar.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte wissen, wenn es irgendwelche Priorisierungen gibt. Vor allem möchte ich diese dann auch ändern können.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es

ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Martina Riehm

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes. This gives too much power to ISP companies to limit what content is available to the consumer because the consumer is often unable to pay for access to certain sites. This can lead to censorship.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Specialised services should offer additional bandwidth and not reduce it from other services.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None should be allowed special treatment.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

They should not be able to interfere at all! They should instead keep developing technology to make connections faster and able to handle larger amounts of traffic.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know all of the above, in addition to whether my browsing or viewing habits are being monitored for any purpose whatsoever.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Mona Harding

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

None!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

freedom is our third urgent thing just the same like life itself and health - DON'T TAKE IT AWAY

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

No - just simply NO!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

not in any way - i get what i pay for ...hmmm, ok, i would like to get what i pay for because it's still somehow slow here in the villages outside crowded areas

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

All 3

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? hmmm, in case that they might easier know when they can kiss my ass?

Hell no! In fact i don't need a big brother watching me!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

mit freundlichen Grüßen,  
Detlef Bassing

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Nein es gibt keinen Bedarf!

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?  
Spezialdienste beeinflussen den Markt künstlich wobei eigentlich bessere Anbieter untergehen weil Sie eben keine Spezialdienste für Sich in Anspruch nehmen können/wollen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Garnicht!

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Mein Internet-Provider sollte mir die durchschnittliche Übertragungsrates meines Anschlusses ebenso mitteilen wie die höchste und niedrigste Rate, und das in einer benutzerfreundlichen Weise, zum Beispiel in einem Diagramm oder einem Musterbild.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Firmen, die finanziell besser gestellt sind, können ihre Dienste leichter anbieten, und damit nicht unbedingt diejenigen Anbieter mit den innovativsten Ideen und Konzepten.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Medizinische Datenübertragung und solche bei Katastrophen und Unfällen, bei denen es um Menschenleben und Gesundheit geht.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Ich möchte unterschiedliche Wahlmöglichkeiten von einem allgemeinen Überblick bis hin zu größtmöglicher Transparenz durch detailliert aufgeschlüsselte Logs haben.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, vor allem keine DPI

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Kein Einfluss, sofern es nicht um die Gesundheit oder das Leben von Menschen geht.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von

Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, the people have a right to privacy if they are not the suspect of serious crimes

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

None at all, the internet shouldn't be throttled for anyone nor by anyone

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have no demand for that. It interferes with my right as an end-user.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see no positive effects of so called specialised services - its just making more money out of something we called internet before.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
no

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No he shouldnt! This interferes with my right to privacy.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I wish to have access to every information the provider has.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their

customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,  
Maritta Strasser

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Any commercial practices which limit user’s rights to free expression and freedom of communication are contrary to the object and purpose of the Regulation.

Is there a demand for specialised services? Which services should be allowed this special treatment? Yeds by the ISP's and no, do not allow it.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Obviously they are designed to hurt consumers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

How much time do you have? Just keep it simple anything else is a waste of my time and my money.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Definitely NOT!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Just my opinion

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, as a provider of data, an ISP should solely track my use of data, not try to analyze and utilize my content consumption for its own benefit.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be able to interfere with my connection or content consumption. Doing so gives an opening for ISPs to manipulate my data usage "for my convenience", without my consent.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). -----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
Immer langsames Internet für immer mehr Geld = Beschränkung und Selektion

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
Nein.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Gar nicht!

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

mit freundlichen Grüßen,  
Martin Thallmair

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,

June Birch/Inside Outsider Publications

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet.

Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[TM#1v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management.

According to its Article 3(3), all traffic management should be as application agnostic as possible.

Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty

about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

Kind regards,  
Phillip M. Edwards

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Yes there is a demand. From big business and from the ISP. Big business wants people to visit their site only and the ISPs are happy to receive extra money to make that a reality. But this is a terrible idea. Not everyone has bottomless pockets to make their website free for the end user by paying a premium to ISPs.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. The ISP should not mess with or spy on my internet traffic in any way.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much information as possible. Speed, Ping, Sync, QoS, Censorship info, everything.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is a demand for such things. However, I think it ill-advised for them to be permitted. As zero-rating is the example of the day, the obvious scenario would be that the providers zero-rate services they favor or provide (or who pay them money), and make the rest of the internet prohibitively expensive. This therefore effectively prevents me from accessing most of the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I actually had an idea earlier today, along the lines of "What if you could arrange for a special super-low-latency link to a given endpoint for business meetings with less obtrusive lag?" Under the assumption that it's possible to eliminate the "bad" kinds of specialized services, while still allowing the "good", then it seems to be a positive thing. However, if the laws aren't careful enough, you could end up with telecom companies exercising unreasonable control over people and the internet.

Is there a demand for specialised services? Which services should be allowed this special treatment? There probably is, but I don't know what kinds should be allowed.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. In an ideal world, that could be beneficial; however, it can too easily be used for the wrong reasons, and I don't trust the intentions of the telecom companies.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

As I previously stated that they shouldn't be able to inspect my traffic for traffic management, they therefore shouldn't be able to interfere with it based upon its type.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

It would be nice to have, say, a map of the connection speeds at different points along my connection to a variety of sites, preferably chosen by me. For instance, when site X is being slow, I don't know if it's their server, their provider, their provider's connection to my provider, or my house connection that's the bottleneck it down. In other words, is it their fault or my ISP's fault?

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no reason to ever allow zero rating. It serves to only limit the rights of consumers.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Larger businesses could easily stifle competition and thusly, innovation by keeping traffic to a slow crawl whenever it suits them.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to know exactly how fast it is at all times, and when it has slowed, the reason why.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, because this would open the door to censorship and unfair business practices. They could decide who deserves fast or slow traffic based on content. For example, protest emails could be slowed or shut down, competitors could pay to slow rival business' traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP's should not be allowed to slow or throttle traffic at all.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There is no consumer demand for it

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO!!!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open,

best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Debra L Dornfeld

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

To me, commercial practices, such as zero-rating, are any method in which a profit-based corporation uses "tricks" to increase profits, without providing more, or better services, essentially, price-gouging.

As for zero-rating itself, there is a growing mountain of evidence that data caps are simply a way to charge more for less service. They should be removed from internet services entirely. Zero-rating is essentially a reverse method of charging for services that an ISP does not want you to access, or that have not payed a "toll" to this ISP.

My name/organisation:

Patrick Roy / None

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Remote Surgery services, allowing qualified persons to operate equipment in realtime over vast distances, to perform operations not otherwise possible. Since lives literally depend on the connection remaining stable and consistent, priority to this kind of service would be paramount, but separate from "internet access", as it is a specialized function.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

I am not familiar with any service that internet providers could provide to the average customer, that do not fall within the confines of existing internet services, and their regulations. If a service requires a fast, uninterrupted connection, then it must have it's own, dedicated network or bandwidth, in addition to the services already provided.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I cannot state enough the gravity of allowing internet service providers, or any other party, to control access, or ease of access, to any part of the internet, website, or service. This would set a precedent for a degradation of access to information and services, which would undermine the very foundation of our economy and social structure, as it stands today.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

If ISPs were allowed to reduce the available bandwidth for news sources other than the ones they endorse, it would lead to a loss of free information, and increase the amount of control these media outlets have on the news and information we receive, and have access to.

ISPs could also stamp out economic competition, and innovation, by strangling the internet access of certain parties at their sole discretion. Don't like a new startup company? Reduce their speeds to a crawl, and they will suffer.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. NO. Definetly not. Nope. N. O.

This is spying, and an invasion of privacy. The only monitoring an ISP needs, and the only monitoring they should be allowed to do, is monitoring the amount of data being sent through their networks, to gauge capacity, and any areas where more capacity is needed.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

For the general public, and public or private networks, an ISP should not be able to interfere with a users internet connection.

If, for example, a business wants to limit employees access to non-business related websites, (aka, to avoid employees wasting time and bandwidth by watching youtube), then they can do that locally, on their own network.

For a service provider to force restrictions on users access to any website or service, is a violation of users rights.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a users?Please, provide examples.

If a user, service, or application, is hogging bandwidth, or otherwise interfering with the network in some way, preventing the service from being used by others, then an ISP is expected to control the network in such a way that all users, services, and applications have equal access, and are not obstructed by another, whether the interruption of service is unintentional, or malicious.

I, personally, have had my internet access interrupted, once, for a few days, by a system that was interfering with my ISPs network as a whole, and bringing all internet access down. I was unable to access the internet until my ISP tracked down and dealt with the problem. This was not a fault of my ISP, but a result of interference.

The first ISP I used forced me to transfer to another ISP, when they suddenly imposed draconian data caps on their service. 15GB a month, for a primary connection, with \$15 per GB over that limit. I was barely able to stay below that limit, without using any online video, or downloading any digital content, such as video games. The one month before I was able to find and transfer to another ISP left me feeling like I needed to avoid the internet. My ability to access information, goods, and services, was suffocated. This all happened, because this ISP could not afford, or did not care to make the expense, of having sufficient bandwidth to handle their user base, and instead adopted tactics to drive people off the internet.

What information would you need to make an informed decision about your Internet connection? For example: traffic management; commercial practices or technical conditions?

I would need to know what speeds, upload and download, an ISP is claiming to provide, as well as the actual speeds their customers are getting. I would need to know about any data caps, any network throttling an ISP may perform, such as burst and sustained speeds. The term of any contract would need to be clear and concise, with any "cancellation fees" included in the main pricing information. Any special terms and conditions, unusual or hidden features or restrictions would need to be spelled out clearly, in common terms understandable by a person with no technical background. A live, human representative should be available, within an hour, to answer any questions I have about the service.

What information would you like to receive about the speed of your Internet connection?

The upload and download speeds, whether the network is able to maintain it's reported speed at all times of day, week, and month, and how well the network is able to connect to other networks, all around the world. Just because a network may get a high speed to a local conneciton, does not mean it can get high speeds everywhere.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

A connection quality graph or chart, with the suitability of the connection for different types of uses should be included, whether for general browsing, online video, gaming, VoIP, or other services. This should include, if available, user ratings/reviews of the service, to ensure transparency.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen, and avid user of the Internet.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREK Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen?  
Keine, jeder Dienst ist wichtig für die jeweilige Einzelperson.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Kleinere Unternehmen wird die Chance genommen sich im Internet richtig zu präsentieren.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Gar nicht, dies widerspricht dem Wort Flatrate.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Alle Informationen die mir zustehen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?

Nein, es ist und bleibt privat welche Daten Pakete versendet werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er

den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

mit freundlichen Grüßen,  
Sven Kilian

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO! This is a foolish option. If even a small chance exists of this system being misused, either now or in the future, then that is enough to outweigh the negligible benefits it would have. YOU HAVE HEARD THIS FROM TEN THOUSAND VOICES. STOP IGNORING THE WISHES OF THE MASSES FOR THE BENEFIT OF THE FEW.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISPs should not be allowed to prioritise certain connections at all. Even if this gives some benefits it will only lead to them trying to profit by punishing the consumer. If implemented at all this should be massively regulated.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as

circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Martin Rose

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

**\*Please enter your name/organisation\***

Pablo Beltrán

**\*Is there a demand for specialised services? Which services should be allowed this special treatment?\***

Banking and payment services are the only services that maybe could be declared specialized, because the faster they are, the less vulnerable they are to crackers.

**\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\***

The positive effect would be the granted access in any situation to a specific vital service. The negative is that, as there are very few examples of these types of services, other services that are not so important may be classified as special and given priority on the network, thus hurting the market and the competition.

**\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\***

There could be a demand if a service a customer already uses is then classified as zero rated by his or her ISP, but I believe this hurts competition as it influences consumers to go for one service or another based on something not directly related to the service in question.

**\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\***

No. I feel this is a strong violation of my privacy and goes against the development of encryption, which I believe is absolutely necessary for a safe and free internet.

**\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\***

Absolutely nothing unless it must slow down all traffic to allow for more users to connect at a specific time due to traffic overflow in a hub.

**\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\***

As much as possible. I'd like all those details and the policies of my ISP to be detailed in the contract , as well as being able to consult the real time quality and speed of my connection at any given moment.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Die bisherige Praxis, nach der alle Netzteilnehmer für ihren eigenen Anschluss aufkommen, sollte nicht durch "kommerzielle Praktiken" ausgehöhlt werden - wenn Verbraucher unseren Cloud-Dienst nicht so gut annehmen, weil ein vergleichbarer Cloud-Service eines großen Anbieters durch dessen Zahlungen schneller oder für Kunden günstiger ist, verzerrt dies den Wettbewerb zu Lasten innovativer Start-Ups und kleiner/mittelständischer Unternehmen und zum einseitigen Nutzen meist US-amerikanischer Konzerne. Solche Praktiken schaden den Innovationstreibern in Europa und führen zu einer Marktkonsolidierung, die durch einen Mangel an Vielfalt am Ende die Verbraucher schädigt - also alle.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Als Positivbeispiel für Spezialdienste werden gerne zeitkritische Nischenanwendungen wie Tele-Chirurgie angeführt, aber auch potentielle Massendienste wie Telemetriedaten für autonome Fahrzeuge. Tatsächlich scheinen nach aktuellem Stand Fahrzeuge sehr gut ohne femtosekundengenaue Daten autonom fahren zu lernen und telechirurgische Eingriffe sollten meiner Ansicht nach gar nicht über das Internet, sondern über eigenständige Netzwerke/Standleitungen zwischen Kliniken abgewickelt werden. Für alle anderen Dienste gilt, was an anderer Stelle schon gesagt wurde: Der Nutzer sollte selbst entscheiden dürfen, welche Dienste er auf dem von ihm bezahlten Netzzugang nutzt - und alle Dienste sollten nach dem Best Effort-Prinzip bedient werden. Jeder Vorstoß in Richtung Priorisierung einzelner Dienste oder Klassen von Diensten ist besser durch konsequente Investitionen in moderne Netze zu lösen als durch die Benachteiligung mehr oder weniger willkürlich von Providern festgelegten Diensten/Klassen.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Es gibt aus unserer Sicht keinen Bedarf für "Spezialdienste". Dienste, welche aus welchen Gründen auch immer tatsächlich in Echtzeit kommunizieren müssen, sollten durch separate Netzwerke/Standleitungen verbunden werden und nicht über das allgemeine Internet (s.o.).

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein, denn zu viele meiner Kunden lassen mich Non-Disclosure Agreements unterzeichnen, verzichten dann aber bei der Datenübermittlung von Geschäftsgeheimnissen oder Messaging / VoIP auf Verschlüsselungsverfahren. Es geht Dritte schlicht nichts an, was ich über welche Anwendung mit wem kommuniziere, alles andere schwächt den Wirtschaftsstandort Deutschland (bzw. EU) und ist letztlich auch ein Einfallstor für Industriespionage!

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Der Provider sollte alle Dienste weiterhin nach dem Best Effort-Prinzip bedienen. Es muss meiner eigenen Entscheidung überlassen werden, welche Dienste ich gleichzeitig nutze und bei welchen ich Qualitätseinbußen oder Wartezeiten akzeptieren will. Statt die Qualität über das Drosseln

bestimmter Anwendungen zu sichern, sollte die Qualität durch Investitionen in ausreichend schnelle Netze gesichert werden.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Die niedrigste, höchste und mittlere Datenrate des Anschlusses (notfalls berechnet aus den Daten der umliegenden Anschlüsse, falls an diesem Hausanschluss vorher noch nie ein Netzabschlusspunkt eingerichtet wurde) und die durchschnittliche Latenzzeit sind die Mindestangaben, die ich qua Gesetz gerne schon VOR Vertragsschluss hätte. Besser noch wären auch Angaben zum Netzwerkmanagement des Providers (z.B. inwiefern VoIP-Telefonie und Datenanschluss interagieren), damit ich diese Regeln beim Vertragsschluss berücksichtigen kann. Wenn irgend möglich sollten die blumigen Versprechungen der Provider von möglichen Anschlussgeschwindigkeiten vor Vertragsschluss durch im Gebrauchsalltag real erzielbare Geschwindigkeiten ersetzt werden - bitte setzen Sie den ärgerlichen Mogelpackungen ein Ende!

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Start-Ups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystems.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte.

Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

mit freundlichen Grüßen,  
Christopher Köbel / DeFrEnT

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
Only practices that are entirely traffic-agnostic.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
If ISPs favor a particular protocol or a particular source / destination for traffic, it could cause users to choose what sites they visit and what they do online based on what the ISPs favor, and not based on the merits of the site. This would threaten the free-market principle of encouraging innovation by free-for-all competition among online content providers.

Is there a demand for specialised services? Which services should be allowed this special treatment? ISPs should be entirely service agnostic. They should not even look at the contents of a packet.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
If the law is sufficiently strong in preventing abuses by enforcing net neutrality, not that much info is needed.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

-----  
Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.

Die Zivilgesellschaft hat keinen Bedarf für "kommerzielle Praktiken".

Meine IP-Telefonate, meine Downloads (z.B. von Sicherheitsaktualisierungen) und meine Homepage dürfen gegenüber dem Datenverkehr von Unternehmen nicht benachteiligt werden.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Es ist zu erwarten, dass die Protokolle von Spezialdiensten auch für andere Datenübertragungen genutzt werden.

Gibt es einen Bedarf für [Spezialdienste](Ein Spezialdienst ist jeder Dienst, der über das Internet angeboten wird und der seitens des Internet-Providers zusätzliche (technische) Berücksichtigung erfordert (z.B. Streaming). Unter der Regelung muss diese Optimierung objektiv notwendig sein, um die technische Erreichbarkeit des Dienstes zu ermöglichen und darf nicht einfach eine Bevorzugung des jeweiligen Angebots sein. Der Internet-Provider muss dabei sicherstellen, dass genügend Kapazität vorhanden ist, so dass andere Dienste dadurch nicht beeinträchtigt werden. Die jeweilige Notwendigkeit muss durch die nationale Regulierungsbehörde überprüft werden. Das bedeutet, ein Spezialdienst kann nicht in eine diskriminatorische Fast-Lane ausarten.)? Welche Dienste sollten diese Sonderstellung bekommen?

Echtzeitdienste wie IP-Telefonie (auch Video-Telefonie) wären wahrscheinlich sinnvolle Kandidaten für eine solche Sonderstellung. Ich sehe nicht, warum z.B. die Übertragung von Filmen priorisiert werden sollte.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

GAR NICHT

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

tatsächliche Übertragungsraten in Relation zur maximalen gebuchten Rate, Limitierungen...

Wichtig ist die Vergleichbarkeit der Daten mit anderen Zugangsprovidern.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Yvonne Wähler

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards.

Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal"

Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16).

Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

No there is no demand for zero-ratings other than as a revenue stream for isp's, any demand was created by the isp themselves by advertising specific content to their users.

Indirectly it will harm other content providers who are not zero rated and that will hurt end users of content as there will be less choice overall.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Make money today to be able to innovate and create new opportunity tomorrow, lose demand and disappear - less choice as a result is not good for all content users today and in the future.

Have isps drop their rates in respect to the revenues generated by select content providers to the end users and suddenly net neutrality makes sense.. (if you consume their approved content your bill should go down if they make any revenue off of your choices and then there is no case. For zero rating content anymore)

Is there a demand for specialised services? Which services should be allowed this special treatment? Yes voip, video on demand, streaming all are specialized services which end users pay for now, but end users already pay isps to access this content via their monthly bill for internet access now hence, no services should be allowed priority over the other - we are not paying isps for content, just their ability to provide access to the internet and to any content accessible therein, its up to the content providers to find their own business case to proceed or disappear.

When isps zero rate content providers its not for their clients benefit but their own. (understandably some isp clients will be happy to access some content without worry but by creating that worry in the first place it makes users less likely to go to other not zero rated content and hence less likely to support other companies out there and that will stifle innovation and growth for less popular sites or new ones.)

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Traffic shaping and dns resolution issues.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No traffic management at all, other than for the purpose to find out who is using most of the available bandwidth.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No - all data should be treated equally

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

With zero rating small new innovative service providers cannot compete with established big players, who can by their own fast lane.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Definitely not - I don't think any government should be allowed to monitor my network traffic, let alone a profit oriented company.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that your Internet provider should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact on their Internet access service. For instance, you should be provided information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities (gaming, video, etc).

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the

prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Commercial practices such as zero-rating are attempts to control what the user does on the internet and should not be allowed.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Any regulation of "specialized services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment? I see no reason that any service should be allowed special treatment over any other.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's should not be allowed to monitor traffic or content for any reason.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP's should not be allowed to interfere with the users connection in any way. Provide the pipe without controlling what goes through it.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content,

applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Michael Partsch

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
It is not their business how I am using my traffic. I have paid them for a clearly specific purpose: being connected to the Internet!

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Zero-Rating beziehungsweise verbilligtes Rating für manche Angebote senkt die Attraktivität aller anderen Anbieter enorm. Schon allein das sollte als Grund ausreichen, diese Vorgehensweise zu verbieten. Eine Firma die gleichzeitig ISP und Streaming-Provider ist kann ihre Kunden so daran hindern zur Konkurrenz zu wechseln, da sonst eventuell massive Gebühren beziehungsweise Einschränkungen auftreten. Somit führt diese Praxis früher oder später zur Monopolbildung und schädigt damit einerseits den Wettbewerb und verhindert andererseits das der Endverbraucher aus mehreren Optionen wählen kann.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

In meinen Augen führt die Bevorzugung von bestimmten Diensten auf lange Sicht nur zur Verschlechterung der Situation im Internet. Beispiel Streaming: Entweder der ISP bevorzugt nur bestimmte Streaming-Dienste, dadurch verhindert er effektiv das neue oder von ihm nicht gewünschte Dienste in seinem Kundennetz Fuß fassen, oder der ISP bevorzugt alle Streaming-Pakete, dann muss er aber alle Pakete analysieren, um festzustellen ob sie Streaming-Pakete sind oder nicht, und greift damit in die Privatsphäre seines Kunden ein.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Es gibt nur wenige Dienste, die eine bevorzugte Behandlung verdienen. Weder Downloads, Online-Games noch Streaming zählen dazu.

Die Kommunikation mit Krankenhäusern beispielsweise könnte ein Kandidat dafür sein. Denkbar wäre ein Spezialdienst der es erlaubt beispielsweise die Statusinformationen von Herzschrittmachern oder Messgeräten in Echtzeit zu überprüfen. Während dieser Vorschlag datenschutz- und sicherheitstechnisch mit den mir bekannten technischen Entwicklungen nur katastrophal umgesetzt werden könnte, wäre es mit besserer Technologie so möglich eine genauere und gleichzeitig etwas krankenhaunabhängigere Überwachung von Patienten mit starken Beschwerden durchzuführen. Dies würde einerseits Räume in den Krankenhäusern sparen und andererseits Früherkennung mancher Komplikationen erlauben.

Andere Dienste, die ich als sinnvoll erachte, sind Kommunikation von und mit Feuerwehren, Polizei und Hilfsorganisationen in Krisengebieten und staatliche Dienste, die z. Bsp. vor Naturkatastrophen oder Gewaltausschreitungen warnen.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Auch für Datenpakete sollte eine Art Briefgeheimnis gelten. Spätestens wenn eine gesicherte Verbindung aufgebaut wird sollte es dem Provider nicht mehr gestattet sein den Verkehr zu überwachen, es sei denn der Nutzer stimmt diesem Verhalten ausdrücklich zu und ist in der Lage diese Zustimmung ohne weiteres (d.h. sofort und ohne Einschränkung) zu widerrufen.

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?

Für den Provider sollte nur die Menge der Daten beziehungsweise die Geschwindigkeit relevant sein, nicht aber, um welche Dateien es sich handelt oder von wem sie stammen. Da zumindest in Deutschland die meisten Haushalte Flatrates mit einer gewissen Geschwindigkeit haben, sollte diese auch für alle Dienste gelten, egal welche es sind. Somit beschränkt sich die Beeinflussung nur auf die Bereitstellung des Anschlusses mit der Geschwindigkeit, für die ich bezahle.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?

Im Idealfall möchte ich von meinem Internetprovider alle Informationen die direkt mit der Verbindungsaufnahme in Verbindung stehen bekommen, sofern sie, aus sicherheitstechnischer Sicht, nicht vor mir bzw dem Provider geheim gehalten werden müssen (d.h. keine Passwörter und vergleichbares).

Dazu zählen neben der Geschwindigkeit, dem Traffic-Management und natürlich der IP auch ob zum Beispiel Packet Inspection durchgeführt wird. Gleichzeitig sollten diese Informationen so genau wie möglich und so greifbar wie nötig gestaltet sein, d.h. ich möchte wissen was genau meine Mindest- und meine Höchststrategie ist, ob das als Diagramm oder Tabelle geschieht ist eher zweitrangig. Dennoch sollten über alle ISPs hinweg eine Einheit für die Geschwindigkeit und die selben Fachbegriffe für z. Bsp. Traffic-Management verwendet werden.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Maximilian Schlosser

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

No! None!

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

Despite you having a 30Mb/s connection, Big companies like Netflix could seem to load faster on your laptop than, say another similar-like start-up. This would give the appearance that netflix is 'better' and destroy entrepreneurship

No positive impacts at all.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

No!

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

NO! Because of how much we do now online, this can be as effective as stalking you. That is a serious breach of privacy and should NEVER be allowed.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

None AT ALL. You should get what you pay for. And if they can't deliver what they promise, they should pay compensation and face fines. Companies should under-estimate rather than over-estimate.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

I want to know exactly what my connection is like and what my ISP is doing, if anything, with it.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen of the UK

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
I don't know.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
One of the negatives is that it could lead to Internet censorship.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No there isn't. No services should be allowed.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
Hell no. This would violate privacy rights.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
Equally.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Here in Canada, sometimes it's fast and sometimes slow.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. Kind regards,  
Sabbath Fan

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

\*Please enter your name/organisation\*

Tomasz Lewoc

\*Is there a demand for specialised services? Which services should be allowed this special treatment?\*

Self-driving cars could actually require special treatment. However, any preferential treatment they receive must be tightly regulated so as not to create any opportunities for abuse. In particular, any regulations must have unambiguous wording and leave nothing to interpretation.

\*What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?\*

I can only see a negative impact: they will undermine competition.

\*Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.\*

I don't believe there is any reason why a consumer would want such practices, because whatever they will always hurt the consumer in the end – not only by stifling competition, but also because cellular networks only have so much bandwidth available, so consumers will pay for zero-rating services by having less network resources available to access other services.

\*Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?\*

I don't like the idea, but ultimately I don't mind, because encryption is now common enough that such monitoring doesn't do \*that\* much.

\*How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?\*

Any such interference should be forbidden.

\*What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?\*

Availability, i.e. how many outage minutes in a given period are allowed before I'm eligible for compensation from the ISP.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service -- no matter how small or well funded -- has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. ---

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment? Consumers who pay for an existing service may be happy if that service receives special treatment in terms of internet traffic, etc. That benefit is not worth the cost to fair competition and innovation that benefits ALL consumers. I have not seen any persuasive justification for any service to receive this special treatment. If emergency police, fire, and ambulance services use internet connections, and if they exist to serve all members of the public equally, then special treatment for those services may be warranted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Companies should not be allowed to buy special privileged arrangements that prevent equal competition on the internet. That will hurt new innovative companies, deprive consumers of improved services, and allow established companies to charge more at the expense of consumers.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

There might be people or entities who favor zero-rating because it gives them favorable treatment. That is not worth the cost to everyone. Zero-rating lets established businesses avoid fair competition with new innovators. That is unfair to new businesses. And it hurts all consumers.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

NO INTERFERENCE.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

NO.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

FULL INFORMATION.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No such demand exists.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
No ISP should be able to interfere with my connection for any reason. Ever.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
Speed I would like to have, and traffic management maybe. The QUALITY of service is what I get to decide.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts

my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Leave it as is.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,  
Tom Urwin

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

The only demand for commercial practices is from large commercial entities. It does not exist otherwise.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no positives.

Is there a demand for specialised services? Which services should be allowed this special treatment?

There is no demand apart from entities that want control.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

"Traffic Management" is a farce and a lie aimed at controlling content for the betterment of who pays the most to dictate the rules and it's a lie in the face of privacy. Do not do this!

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I want to know all of that. I'm paying for it!

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating clearly contradicts the intention of the legislators in protecting the open and unrestricted access to the Internet. Zero rating limits the possibility for users to distribute content, services, or applications, which undermines innovation, dialogue, or exchange of knowledge.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

While the provision of specialised services is allowed under the Regulation, they cannot be offered as a replacement for Internet access services. In its 2012 guidelines, BEREC stated that price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of "specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

As much as possible, such as speed, quality, management.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, respect my right to privacy and let me see what I want to see, please.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create

regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

On the surface Zero Rating may seem like a good thing but the reality is it will only hurt the end user.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
None.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Not allowing start ups to compete.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of the above.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

No interference whatsoever.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for "commercial practices" such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Is there a demand? Yes, I can see a demand for zero-rating from companies such as Facebook for whom this means that people are more likely to use their "free" services to access the Internet, instead of "more expensive" open network. This, in turn, that big companies get a better stand in forging public opinion by feeding people curated and opinionated view of the world, all by the fact that people like using "free" services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Infrastructure that is not maintained deteriorates. If ISPs were given the possibility to prioritise only certain kinds of traffic they could start paying less attention to "common, non-specialised" traffic which would mean a decline in overall quality of service.

Is there a demand for specialised services? Which services should be allowed this special treatment?

Specialised services *can* be implemented using existing technology. There is minimal need to create more channels of prioritisation.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Of course not! An ISP is like a post office, and my traffic is like my letters - all are equal, expect the same quality of service, and are not opened at the post office to determine how they should be handled.

Also, deep packet inspection is a huge breach of privacy and trust. I *don't* want ISPs to deeply inspect my banking traffic (even if it's encrypted) or my sniffing my secure shell connections to remote servers under guise of improving "quality of service".

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP should not interfere with my connection *at all*. They are in the business of *providing* the connection, not disrupting it.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

As an end user & living in rural area with slow internet as is it would be disaster to me by introducing these rules & limitations

Is there a demand for specialised services? Which services should be allowed this special treatment?  
No

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, called monopoly

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP has no right to slow my internet access to boost their profit & control over my rights & life

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Monopoly is not acceptable

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Having had previous experience with big companies, I can say without a doubt that the end user would get hosed eventually.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Just treat us all the same.

Is there a demand for specialised services? Which services should be allowed this special treatment? Not that I am aware of.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Not in the slightest.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Minimal, if at all.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I just want assurances that I'm not being slowed down deliberately.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of

key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,

Dear Sir / Madam,  
Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Implementation

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. Your traffic is private information.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The ISP is a service provider. This service should not be tiered at their discretion.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole. The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I don't think there is to be honest. People forget that laws are made only for the honest person. The criminals don't care. I'm tired of my rights being trampled on because of what might happen. No one can be fully protected. If criminals really want something they going to find a way to get it.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

Only if a crime has been committed. Anything along criminal lines then yes. Otherwise no. You don't need to know in detail to control traffic. No company has the right to violate my privacy simply for that

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Instead of throttling my internet speeds they should find other ways of managing horrendous amounts of traffic. For the prices they gouge us for they should take some of it back out of their pockets and put it in to finding these things out.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,  
Jennifer Case

Dear Sir or Madam,

Please find below my comments regarding the BEREC net neutrality guidelines creation. I would appreciate if you would take them into consideration.

My name/organisation:

Hans-Josef Mauve

The diversity and capacity to create innovations of the Internet is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one everybody – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. There have been many suggestions for specialised services which don't meet these requirements and are therefore endangering the freedom of the internet. For example services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

ISPs are paid for their services by their customers; if they believe that this payment is insufficient they should increase their fees. When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate,

transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

Hans-Josef Mauve

-----  
Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these

safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Kind regards,  
Mark Reback

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich müsste auf bestimmte Dienste wechseln, weil ich so vorteile im Daten-Volumen bekommen würde.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Der Datenverkehr sollte nicht überwacht werden.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeinen Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist

besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Maciej Krüger

-----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BERC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.  
NA??

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?  
For E Commerce I say Yes, & for jobs & profits.  
Niche services should NOT throttle down Internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?  
Only my niche IE Custom Cars, Data Security, Innovation, Cyberinvestigations, Counter Terrorism & otherwise NO special treatment given

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
NO, unless Natl Emergency if any, otherwise NO & to counter terrorism I say Yes.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
None, Max my speed out or add more Routers or servers to system

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
My speed, Data Up/Down Loads & Security.  
IE hey U need a better computer your models age Slows the Internet down.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

ISP's should not be using the particulars of my data in order to determine the level of service to which my communication is entitled.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Individuals and enterprises who develop specialized services are entitled to use the Internet like anyone else. They should not be tampering with my access to the Internet.

Is there a demand for specialised services? Which services should be allowed this special treatment?

The only specialized services I can think of that should have any priority would be security and antivirus/malware services.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

ISP's don't need to monitor my confidential information in order to manage traffic.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

ISP's should not be examining my activity and content in order to decide how to send it. My information should flow with the speed of the Internet.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

I would like to receive an open, direct, and non-technical description of the Internet services associated with the account, including any impediments to receiving open access similar to all other consumers.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. -----  
Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I have no personal demand for commercial practices such as zero-rating - I would prefer all connections I make be treated equally even if it comes at the cost of a fairly increased bill. These practices could limit my rights as an end-user, as when an ISP prioritizes the connections made by a specific application, it is by nature depriving the connections of other applications. If my preference is to only use the applications which are being deprived, then I as an end-user am being deprived of the quality connection which I expected when entering a contract with my ISP.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?  
No.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?  
ISPs should not be able to interfere with our Internet connections whatsoever - they should provide and fulfill a constant bandwidth to their consumers.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?  
I would like a listing and accurate description of all practices which my ISP utilizes in managing my Internet connection to be made easily available to the public. If an ISP is throttling, providing a connection other than that agreed upon, prioritizing some domains over others, or otherwise intentionally or unintentionally affecting quality of service, their consumers deserve to be notified quickly and accurately.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

In all honesty, I cannot recall any examples of this issue, at the moment, so I won't even attempt to answer what I believe.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No, because all that will do is encourage more ownership by corporations, rather than helping small businesses.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all!

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREK Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele.  
NEIN (NO)

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten?

Ich sehe keine positiven - nur negative Einflüsse (I am not able to see positive Impacts - only negative)

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Bereits jetzt gibt es die Möglichkeit von Kunden, sich Anschlüsse mit gesicherten Datendurchsätzen bereit stellen zu lassen. Eine weitere Regelung ist nicht notwendig. Ein Bedarf ist nicht erkennbar. (Acually there is the possibility to get Connections with specific data rate guaranteed. Further regulations are not necessary. A demand for Special Services can not be identified)

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können?  
NEIN !!! (NO !!!)

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)?  
Ungehinderter Zugang zu allen technisch möglichen Diensten und Protokollen (unlimited Access to all possible Services and protocols)

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)?  
Minimum guaranteed data rate, average data rate, Maximum data rate, volume restrictions, protocol & Service restrictions (if exists)

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best

Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Ausserdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von Klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

mit freundlichen Grüßen,  
Privat

Dear Sir or Madam,  
Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

In my view there is no there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars). Specialised services should must not include regular content and applications readily available - or capable of being made readily available - across the Internet. It is especially important that content and applications that are available over the Internet access service are not recategorised - as this would result in the exact opposite of net neutrality.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Price discrimination practices offering access to a limited part of the Internet would have a negative effect on consumers' rights. Any regulation of specialised services" which would allow a discriminatory "fast lane" for services that could otherwise be provided on the open Internet must be avoided, in order to protect freedom of communication, competition and innovation.

Is there a demand for specialised services? Which services should be allowed this special treatment?

In my view there is no there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars). Specialised services should must not include regular content and applications readily available - or capable of being made readily available - across the Internet. It is especially important that content and applications that are available over the Internet access service are not recategorised - as this would result in the exact opposite of net neutrality.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Internet Service Providers (ISP) should tell the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image. This means that ISPs should not be allowed to display the maximum possible speed as being generally available, as this would be misleading about the actual speed that is normally available.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

The EU Regulation prohibits specific traffic monitoring. Practices such as deep packet inspection (DPI) undermine my right to privacy and go against EU data protection and privacy rules. In my view DPI is an invasive surveillance and censorship technology.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

The EU Regulation requires Internet service providers to treat all traffic equally. There is however uncertainty about "special categories" of traffic. The Regulation says that the objective of reasonable traffic management is to contribute to an “efficient use of network resources and to an optimisation of overall transmission quality” , without the use of commercial criteria. If not properly clarified by

regulators, providers could use this potential loophole to apply disguised commercial criteria to arbitrarily classify certain categories of traffic, in order to prioritise one category over another. This discrimination would undermine net neutrality, to the detriment of free speech, innovation and openness

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Kind regards,  
Tim Dornsiepen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Mathieu Roquefort

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen
