Allowing ISPs to charge for fast-lanes motivates them to make the rest of the Internet slower. The EU Regulation on Net Neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

Sincerely,

Jean Stansfield

Subject: Feedback about net neutrality
Date: 03 July 2016 16:46:25

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Of course there is a demand for zero-rating practices from the end users' point of view. Who would not like being able to watch as much netflix content on one's device as possible?
But from social and environmental points of view, it enhances negative externalities and the risk of a wrong allocation of rare resources (energy, ...).
So it would be better to forbid it.

My name/organisation:
Jean-Michel Ycre

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
yes, there is.
Internet traffic could be optimised according to the nature of information transmitted.
For instance, the data of a video of a surgery act done at a distance by a surgeon should have top priority over of a movie.
The ISPs should not be given the possibility to choose which data is priority.
It is a matter of human rights and should be treated at a top international level (UNESCO, UNICEF, ...)

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
yes, it is quite normal that providers follow how and how much their customers are using the service that they provide.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
The ISP should not be able to interfere at all.
An independent authority might be allowed to interfere for the sake of more important matters (e-health data, education data...)

What information would you like to receive about the speed of your Internet connection?
The price of the connection should be closely related by contract terms to the actual speed of the internet connection.
It is not admissible that providers can offer commercial promises of speeds "up to 1 Gb/s", when the reality is largely below the commercial promises.
Clients should be provided with information about the quality of service provided and penalties should be paid if the quality do not match the commercial promises.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end

users? Should these parameters be defined in the contract? If so, how?

Yes they should be defined in the contract.

The question is rather to define how they should be monitored, so that clients can follow if the quality of service is correctly delivered.

One could imagine that providers send a monthly report giving some stats about the parameters of the connection (top and low values, average value during use time).

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services

cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating

infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Subject: Feedback on net neutrality guidelines creation
Date: 16 July 2016 10:36:22
Attachments: [signature.asc](#)

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
Specialized service have a negative impact on which software can or even must be used to use these services. Proprietary interfaces and close-source software could be required. Usage of standards and open source software might be hindered.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No, this should be not allowed.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
On a very low level. And it must always be transparently documented for the end-user which policies are active.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Oh, yes.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

I have to know

- that I can use any network hardware (router, modem) to connect to the ISP
- that I can offer internet services myself on my home server
- that services I offer are not limited to certain ports or content

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses

guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay

to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”.

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only

intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Anonymus

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

From: [Markus Adam](#)
To: [NN-Consultation](#)
Subject: For the net neutrality and no to zero ratings
Date: 15 July 2016 01:06:28

Dear Consultation team,

TL;DR: I implore you to state in the regulation that the use of zero rating is not allowed.

Zero rating and similar instruments of traffic control is a blatant try to generate money from additional sources. The cost of operating a network consist of the cost for the hardware and the electricity to run it; how much data is flowing there is irrelevant! The side effect of such a traffic regulation will have a **massive** impact on the daily life and cutting user rights and free access to any data.

Permitting zero rating in any form will lock any end-user to his ISP's preferred service with increasing data volume. And since the data traffic is increasing exponentially, this will exclude end-user who are not able to pay the higher tariffs.

Any zero rating or traffic control will be used to hinder the ISP's competition on that certain service it is applied to. The end-user will be locked into the ISP's services and has to be technically experienced or financially capable of leaving this ""bubble" behind. Or, e.g. new services/companys with very high data volume requirements will be unable to be used by customers unless extra-fees will be paid. Which will be nigh to impossible for start-ups or non-commercial purposes.

And regarding the threat of stopping investments on 5G-infrastructure by several big TelCos; this may delay 5G a bit but we will get there in the end. And it would be a good idea to seperate the infrastructure from the ISP as it was done with the railway company or the electric grid.

With best regards,

Markus Adam

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit

services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are

commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”.. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The

draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Reiner Jonas
Essen , Germany

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised

services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that

"National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—

regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Manuel López Souto

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and

start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this

regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the

complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

Internet itself should be "non-commercial". We don't pay for basic mathematics. It's part of our cultural being. Zero-rating just puts a veil on internet traffic. The last possible chance to be equal: cash or broke.

My name/organisation:
Jens Kaeding

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? Free access to all internet services should be treated like any other human right should be.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
No matter. Free internet services for everyone.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
Free internet enables everyone to contribute to our development. There should be no "payable" special services.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Yes. Commercial practices limit my rights: The internet should be the backbone of our culture. Not another way to make profit. Example: Advertisements slow down my PC, while I'm just searching the best physician to treat my disease!

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No. Not for commercial issues or for legal issues.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
In no way. I pay for internet access. Not for regulating it. There are no priorities.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

No limitations should be applied. Slow servers might provide the best service.

What would you consider to be "reasonable" traffic management measures?
How can "unreasonable" traffic management measures affect you as a user?
Please, provide examples.

Just slow down "spam". If there's no more unnecessary traffic, the resources will be sufficient.

Why can't the internet be free of advertisement. Cash for pop-ups is wrong.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

Any information. Every bit of information on my online behavior is my concern.

What information would you like to receive about the speed of your Internet connection?

Answer time, real download rate / speed.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Every user should pay for the real download / upload traffic, not for what they might be able to..

The more traffic, the more cash.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential

treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate

implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article

3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen and hopeful individual.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?
commercial demand may be but not bearable

My name/organisation:
Günter Hagen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
none

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
no

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
discrimination, cutting consumer rights

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
yes

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
no

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by

the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Leonard Schiller

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Subject: Future of the internet
Date: 16 July 2016 16:04:22

Every user of the internet should have equal access, with no priority being given for specific purposes. This could disadvantage users who do not use those services, and adversely affect their service speeds. ISPs should provide average speeds over one month.

Thank you.

Stuart Froment

#the bellow message advised I forward my comments on to this email address...

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

I want a internet full of diverse independent voices/sites/truffles that can discuss dissent and form consensus (or not) independently.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

the internet could look like cable television, and become a blunt single use tool.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

just maintain the pipes...

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

when you're using a larger bandwidth than you're paying for.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

be open with me. Send me the info.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers

and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,
Gardner / LA

Dear Madam or Sir,

Please note that BEREC is now inviting comments from all citizens and stakeholders on the draft guidelines.

If you would like to comment on the draft guidelines, you can do so till July 18th by sending your consultation response to NN-Consultation@bereg.europa.eu.

For further information and news about net neutrality please visit our website: <https://www.rtr.at/netneutrality>
This website is also available in German: <https://www.rtr.at/nn>

Best regards

your RTR Team

[Netzneutralität EU.pdf](#)

Sehr geehrte Damen und Herren,

mit großer Besorgnis verfolge ich die Lobbyarbeit bestimmter Netzanbieter mit dem Ziel kostenpflichtige Sonderdienste zu etablieren, wodurch die Netzneutralität ausgehöhlt wird.

Als Mitglied des Medienrats der Landesanstalt für Kommunikation Baden-Württemberg, Deutschland, und Vorsitzender des Ausschusses Medienkonvergenz und Digitale Gesellschaft des Medienrats hatte ich schon zu den Beratungen im EU-Parlament mit Sorge Stellung bezogen. Auch hat sich der Medienrat der Landesanstalt für Kommunikation in einer Resolution (siehe Anlage) für die Netzneutralität und gegen Sonderdienste ausgesprochen.

Ich schließe mich daher den Bedenken gegen den Entwurf der Richtlinie in vollem Umfang an und darf hierzu auf die beigefügte Stellungnahme verweisen. Ich appelliere an die BEREK, Sonderdienste nur für absolute Ausnahmesituationen zuzulassen.

Mit freundlichen Grüßen
Emanuel H. Burkhardt

Subject: Good Governance for the Internet !
Date: 15 July 2016 06:59:32

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Today, the internet is just as real as the material world. It is public space and allmende. We know it is a powerful and sensitive resource that has to be used and ruled in the public interest to be productive.

It is absolutely vital for the future of our European model of democracy and freedom that rule of law, free speech, and public space are provided and protected by the government against all vested interest. It does not matter whether it is individual or corporate, spiritual or commercial.

Provider want to become modern landlords while we need them as stewards and caretakers in the public interest and under public control.

Commercial practice is a useful and effective option for private commercial partners. It is not an option for good governance. Exclusive or privileged cooperation f.e. can enable lower transaction cost for consumer and producer. Even in private business, there is always a risk to create closed shops and windfall profits which block innovation and effective solutions. For public goods and services it can serve as a benchmark but may not be installed as a ruling principle.

ISP should be free to prioritise or discriminate against certain products or services only if there is a competitive and accessible market for ISP on the provider-side and on the consumer-side.

My name/organisation:
Albrecht Kasper

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Subject: Guideline suggestions
Date: 16 July 2016 17:25:05

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Kálmánczhelyi Gábor

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No, and it would harm the users' privacy in worrisome ways.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
They should not be able to do it any way.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Yes.

What information would you like to receive about the speed of your Internet connection?
The maximum and minimum speed of uploading and downloading, and what could interfere with it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised

services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the

structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

To: NN-Consultation: allow-submission-to-berec@consultation.savetheinternet.eu
Subject: guidelines creation into consideration
Date: 19 June 2016 15:11:12

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Zero-rating could be a form of censorship applied arbitrarily by the ISP on the contents of internet.

Furthermore, could force the utents of internet to suffer contents, that they don't require.

My name/organisation:
Vincenzo Settembre

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

I think that mustn't be services required for the people, who surfing on the web.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

I don't know.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

These services can limit the possibility of the companies to reach the buyers, controlled by ISPs

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Yes, sure. For example, you can't access to Internet if you don't visualize a content.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

I think that the ISP shouldn't visualize the content of the traffic, but this content must be available only to authorities. For example, in case of crimes, and never for commercial purposes.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

The ISP shouldn't interfere with my internet connection.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

My freedom surely can be limited by ISPs discriminated between online content.

What would you consider to be "reasonable" traffic management measures? How can

"unreasonable" traffic management measures affect you as a user? Please, provide examples.

The traffic management measures can be reasonable only if these measures are equally distributed on all the contents. They don't have to create contents of league A and league B.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

ISP doesn't provide information of how work traffic management practices.

What information would you like to receive about the speed of your Internet connection? An information about the real speed on the moment of my internet connection, not about the maximum capacity of speed, as do all the internet providers.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I think that in the contract must be defined the capacity minimum of the speed of my internet connection and not in terms of maximum capacities. In this way the contract can be more transparent.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation

guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of

Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft

guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? No, why should there be a demand for "commercial practices" such as zero rating? Zero rating itself is marketing bullshit for not offering flatrate internet access. Why would we even need this zero-rating crap when people had a reliable internet connection at decent speeds because ISPs would finally invest in their infrastructure. Wonder who can come up with that stupid questions...

My name/organisation:

I'm strictly opposed to "fast-lanes". ISP should just invest more in their infrastructure, then we wouldn't even have to talk about such a bullshit idea. I guess it's just another desperate try of industry and politics to control and censor the internet. The free internet we had end of the 90' is gone already, and that stupid buy-net filled with advertisers and annoying popups is supposed to get even worse in the future?

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

This is marketing bullshit. No service or application justifies "specialised" or "optimised" services. In the end it's all offered over the internet. Just because some of your marketing idiots give it a different name doesn't change the fact that it's all the internet.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

No. ISPs just have to improve their infrastructure which should not be a problem given the amount of money we pay for internet in Europe. If infrastructure is fast and reliable the actual "best-effort" principle is more than sufficient for every single imaginable online service. No need to slow down what you don't like. Especially in regards of connected cars, I happen to be an expert in telematics, all we need is good coverage. Your bullshit specialized services won't not change anything to the fact that usually when driving to a rural area the best connection we can get is 2G. Get the ISPs to setup LTE everywhere, problem solved. Again, no need to censor what you don't like and bullshit us that it'll make the rest faster, just invest.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Can't think of any positive impact, except:

1. The UE will get rid of freedom of speech through censorship
2. The EU will make the internet a pure "cleaneternet" as seen in <http://www.cleaneternet.org/>
3. ISPs can go on and overcharge people for whatever they want

Negative impact: (I listed some pros of net neutrality here)

- Network neutrality avoids that ISPs charge online services such as Xbox Live, Playstation Plus, Skype, and Netflix for "fast lanes". These extra costs for "fast lanes" are problematic because they can make the services more expensive for internet users and also may prevent small companies from the capacity to compete with the big companies who have the budget to reach agreements with ISPs.
- Net neutrality avoids discrimination among users ensuring similar access to information for people of different socio-economic status. Without neutrality, high-speed internet for entertainment could be prioritized over education. And ISPs could change premium fees ("pay-to-play") to enjoy special access to public libraries, benefiting the richest people.
- Network neutrality helps to promote freedom of choice, as ISPs cannot obstruct or incentivize particular contents or sites over others.
- Anti-blocking and anti-discrimination rules prevent the capacity of ISPs to arbitrary decide to limit access or promote some type of content. The role of ISPs is to only "transport" data to the users that have paid for delivery, and therefore they should not shape content consumption patterns.
- Net neutrality promotes a level playing field for competing companies.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Yes, they do. Dangers of zero-rating:

1. Distorting Content Consumption

Zero rating may provide an unfair advantage to the provider of the content that is zero rated, compared to other content providers or potential new entrants. For example, one preliminary study in South Africa suggested that a zero-rating plan for Twitter caused a significant spike in Twitter usage while the promotion was in place. The same study observed an even more dramatic spike as a result of a similar program zero-rating WhatsApp. This may be more of a problem when the content provider is already popular (such as Facebook or Google), than when the content provider is small and local, perhaps offering content in a local language or to a local community. The point is: zero-rating funnels internet users to the content and services that are zero-rated at the expense of alternatives. Even schemes that purport to be open to widespread participation in fact make choices about who may join and how to allocate resources to enable different services to join the program. For example, T-Mobile's zero-rating programs have favored commercial over noncommercial services and have favored music and video over other types of data (such as video chat or online gaming).

2. Distorting Access Markets

Similarly, there may be an unfair advantage to the network operator who zero rates their own content, compared to competing operators who don't do so. For example, by zero rating their own app, music or video stores they have a better chance of locking their customers in to their service. This is likely to be less of a problem in more competitive markets where the consumer has a wide choice of network operators, especially if there is also an antitrust regulator who can step in to curtail practices that have particularly anti-competitive effects.

3. The Walled Garden Effect

Zero rating limits users to a narrow experience of the Internet, and disincentivizes them from venturing beyond those services that are provided for free. This is an argument commonly directed against Facebook's Free Basics service that is offered in several developing countries. Indeed, there is evidence that at least some users may never venture beyond Facebook. Mark Zuckerberg claims to have data that half of Free Basics users in fact upgrade to full Internet access within 30 days, but this net positive effect on Internet

access seems to be minimal. Given the habits of the typical Internet user, those who upgrade likely continue to disproportionately use the services they could sign up for during their stint with zero-rating, a lasting harm to competition and public discourse.

4. Privacy and Security

Every zero rating program in existence today has required the establishment of new Internet gatekeepers, who create a chokepoint for control of users' Internet experience. In order to enforce their zero rating policies, these gatekeepers may be required to engage in deep packet inspection, or to disallow the use of encryption, in either case introducing significant privacy and security problems that otherwise would not exist.

5. Centralizing Power in New Internet Gatekeepers

Beyond the obvious potential impacts on competition, privacy and security, zero-rating plans may cause a more fundamental harm: Widely embraced, they threaten to rewrite the rules upon which the Internet was built. By turning service providers into gatekeepers – even benevolent ones -- zero-rating helps transform the Internet from a permission-less environment (in which anyone can develop a new app or protocol and deploy it, confident that the Internet treats all traffic equally) into one in which developers effectively need to seek approval from ISPs before deploying their latest groundbreaking technology. With zero rating, developers and engineers are no longer able to depend on the core assumption that the Internet treats all data equally. Content providers who have to make tradeoffs about which zero-rating technical requirements to implement will tend to favor the ISPs who already have the largest audiences, further cementing the largest incumbents in those markets. The result may benefit big ISPs and incumbent content platforms who can play the zero rating game to their advantage, but likely not innovators and users who can't.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No, this is the worst violation of privacy I have ever come across. If ISPs had good and reliable infrastructures they wouldn't need that much "traffic management" which is just an excuse to not improve their networks.

Let me ask you a question: Should your mail man be allowed to monitor all your mail, including reading all your correspondence for the purpose of checking if he should deliver your mail today or next week because he thinks it's not that important, or never because he thinks you should not read what your friend wrote? What a stupid idea...

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Not at all!!!!

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes. Read about the best effort principle and understand how it works before trying to make new stupid rules.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

There's nothing like reasonable traffic management. You guys probably don't have brains, correct? Because if you did, I wouldn't really have to answer that question. What if your provider gives priority to a video platform or TV channel that you don't want to use, and leaves you unable to use your favorite platform or channel? What if the provider keeps claiming that the network is busy, and keeps slowing down the services you want to use?

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

I would always only consider an internet connection where my ISP ensures to respect the principle of net neutrality.

Traffic management and commercial practices are red flags and would just make me look for another ISP.

What information would you like to receive about the speed of your Internet connection?

Did you ever use the internet yourself? You can just go on pages like speed test (www.speedtest.com) and test your own connection. All I need to know is what maximum speed can be provided where I live and is it flat-rate since I'm not willing to pay for data packages like some bad operators offer for mobile phone internet.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Latency is useful to know especially for online gaming or service such as video telephony, e.g. skype. Why should I care about jitter or packet loss, just provide me an open best effort internet and everything is fine. If a packet gets lost, there are mechanisms in the tcp ip protocol to ensure the packet is re-transmitted so an end user wouldn't even notice.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental

to the development of the free, open and innovative Internet ecosystem.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Ben Bierens

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

The power of the internet is the fact that it's general-purpose. The same uplink can be used for video, audio, gaming, social interactions, and much more. Any service that would restrict, subtract, or divert from this broad range of applications will undermine the usefulness of the internet, and ultimately its value.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)? There is no justification for specialised services for a particular field or domain as no ones is in the position to decide which services are important enough to the majority of the internet users.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Increasingly, cloud-based services are interconnected and rely on each other to service the requests from their users. Specialized services would hinder innovation by segregating online services, preventing users and companies from benefiting from the interoperability.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all

networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.?

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of

the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it.

Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Subject: I have a Gold bar for sale!!
Date: 23 June 2016 22:29:44

Good Day,

My name is Derrick Ofori Kofi i am a director of field operation Ghana custom excise and preventative service. i am in searching for honest gold dealer or who knows anyone who deal on gold that i can trust to help me receive 76 kilograms of gold i have here and sell it in his or her country. we shall conduct the business on mutual benefit of both of us. to be frank with you i seized the gold from the illegal exporters at the Kotoka International Airport Accra Ghana when they were about to smuggle it into Airline and ship it out of the country without following the Ghana Government procedure on gold shipment but i have legalized it in my name as the owner.

I will be very grateful if you can indicate your interest to help me sell the gold in your country.i am happily married with kids and love my job and never wish to loose it. Please all i need from you is a maximum trust and honesty and also promise that you keep the almost secret and confidentiality in order for us to achieve this deal successfully. i would like you to send me your personal contact details before we commence this business.

I wait for your respond.

Thank you
Kind regards,
Derrick Ofori Kofi

Four Days to Save the Open Internet in Europe: An Open Letter

[Web Foundation](#) · July 14, 2016

- [Web We Want](#)

The post below is an open letter to European citizens, lawmakers and regulators, from our founder and Web inventor Sir Tim Berners-Lee, Professor Barbara van Schewick, and Professor Larry Lessig. Join the conversation in the comments below or on Twitter using #savetheinternet or #netneutrality.

—

We have four days to save the open Internet in Europe

By Sir Tim Berners-Lee, Professor Lawrence Lessig, and Professor Barbara van Schewick

Network neutrality for hundreds of millions of Europeans is within our grasp. Securing this is essential to preserve the open Internet as a driver for economic growth and social progress. But the public needs to tell regulators **now** to strengthen safeguards, and not cave in to telecommunications carriers' manipulative tactics.

We are so close. In October, the European Parliament voted on network neutrality rules for the European Union. Now regulators are writing guidelines to determine how the law will be applied in practice. These guidelines could secure net neutrality in Europe – if regulators use them to close potential loopholes in the law.

Telecom companies know this. And so they are lobbying hard to get regulators to adopt weak guidelines that would benefit their businesses over the public interest. They have connections to the highest levels of EU governments, a well-oiled lobbying machine, and lots of money to pay lawyers and experts to write extensive comments. Their latest move came last Wednesday, when the 17 largest telecom companies in Europe [threatened not to invest](#) in the next generation of 5G mobile networks unless regulators water down the guidelines.

We – the ordinary users of the Internet – don't have expensive lobbyists. But we have millions of people – everyday Europeans, startups, investors, small businesses, activists, NGOs, bloggers, independent artists – who have experienced the power of the open Internet first hand and want to protect it.

That's where you come in. For a few more days, **until July 18**, the public has an opportunity to comment on the guidelines and convince regulators to close loopholes and protect the open Internet in Europe.

The Internet has become the critical infrastructure of our time – for our daily life, for our economy, for our democracy. Strong guidelines will protect the future of competition, innovation, and creative expression in Europe, enhancing Europe's ability to lead in the digital economy. They will ensure that every European, no matter the color of their skin or the size of their wallets, has an equal chance to innovate, compete, speak, organize, and connect online.

If we speak up now, we can convince regulators to do the right thing.

Here's what you can do to help.

Speak Up:

Before July 18th, 14:00 CEST, visit www.savenetneutrality.eu or www.savetheinternet.eu to participate in the public consultation by submitting a comment in support of strong net neutrality rules.

Spread the Word:

Share this post and others on Facebook, Twitter, or anywhere else, using #savetheinternet and/or #netneutrality.

Talk with your friends, colleagues, and family and ask them to [take action](#).

If you are a blogger or journalist, write about what is going on.

If you are an entrepreneur or investor, review and [sign](#) the entrepreneurs' letter.

If you have a blog or a website, protest Internet slow lanes by [adding a widget to your site](#).

There are four areas that regulators need to get right to secure meaningful net neutrality in Europe.

1. **BAN FAST LANES: Regulators need to close a loophole that could allow carriers to offer special “fast lanes” to normal websites and applications for a fee.**

The telecom companies that connect us to the Internet want the power to charge websites extra fees to reach people faster. In a world where some websites can pay telcos to be in the “fast lane,” anyone who can’t afford the extra fees – start-ups, small businesses, bloggers, artists, activists, and everyday Europeans – will be left behind in the slow lane. Innovation and economic growth will suffer, and Europeans will be left with an Internet that is less vibrant, less diverse, and less useful.

Europe’s net neutrality law stops telecom carriers from creating fast lanes online. But it contains an exception for “specialized services” that cannot work on the regular Internet. Carriers want to squeeze as much of a pay-to-play business model as they can into this exception, turning it into a giant loophole. [Their stated goal](#): A world in which any application can buy a fast lane – not just those that could not function without it.

Regulators need to close this loophole by clarifying that the “specialized services” exception cannot be used to create fast lanes for normal Internet content. And they should regularly review what qualifies as a specialised service – remember that in the not too distant past, everyday services like web-based email or online video would have been seen as a specialized service!

2. **BAN ZERO-RATING: Regulators need to ban harmful forms of zero-rating.**

Carriers want to be able to exempt certain favored applications from users’ monthly data caps, a practice called “zero-rating”.

Like fast lanes, zero-rating lets carriers pick winners and losers by making certain apps more attractive than others. And like fast lanes, zero-rating hurts users, innovation, competition, and creative expression. In advanced economies like those in the European Union, there is no argument for zero-rating as a potential onramp to the Internet for first-time users.

The draft guidelines acknowledge that zero-rating can be harmful, but they leave it to national regulators to evaluate zero-rating plans on a case-by-case basis. Letting national regulators address zero-rating case-by-case disadvantages Internet users, start-ups, and small businesses that do not have the time or resources to defend themselves against discriminatory zero-rating before 28 different regulators.

The guidelines need a comprehensive, Europe-wide ban on harmful forms of zero-rating.

3. **BAN DISCRIMINATION: Regulators need to prevent carriers from discriminating among classes of traffic to manage their networks.**

Carriers would like to define classes of traffic to be sped up or slowed down, even in the absence of congestion. They say this will let them offer better quality Internet access. But class-based traffic management lets carriers discriminate against services at will. It allows carriers to distort competition, stifle innovation, and hurt users and providers who encrypt by putting all encrypted traffic in the slow lane.

The draft guidelines make clear that class-based traffic management can only be used as a last resort during exceptional or temporary congestion if less discriminatory methods cannot solve the problem. This is good, and ensures that the Internet remains a level playing field even during times of severe congestion.

But the guidelines are less clear for traffic management in the absence of congestion. This ambiguity could be misused as a loophole to allow carriers to discriminate in the name of addressing problems admittedly less severe than congestion, where discrimination can only be used as a last resort.

The draft guidelines should clarify that class-based traffic management can be used only if less discriminatory, application-agnostic methods cannot solve the problem, regardless of whether there is congestion or not.

4. **PROTECT INTERNET ACCESS: Regulators need to prohibit new “specialized” services**

from taking over bandwidth that people bought to access the Internet.

Carriers want to offer new kinds of “specialized” services that need special handling not available on the Internet. People would buy these services separately, in addition to their normal Internet access. Carriers find these services attractive because they can charge the providers of these services extra fees for special treatment.

The draft guidelines allow these specialized services to take away bandwidth from people’s Internet connection. In essence, telecom companies would take bandwidth that a customer bought to connect to the Internet and use it for a specialized service that the same person (and, potentially, the providers of these services) is paying for separately. That means people signing up for a specialized service would pay twice for the same bandwidth, and would have less bandwidth available for the websites and Internet apps of their choice. This harms people signing up for a specialized service, and makes it harder for Internet applications, content, and services to reach consumers.

The current version of the guidelines directly contradicts the law, which requires that specialized services be offered in addition to access to the Internet and must not reduce the quality of normal Internet access. Regulators need to correct the guidelines.

. . .

Telecom regulators can still protect net neutrality in Europe – if they make the key changes described above. We urge regulators to make these changes. And we urge you to contact those regulators before July 18th and let them know the public supports strong network neutrality guidelines.

We have four days to save the open Internet in Europe. Let’s use them.

Take action before July 18th, 14:00 CEST here:

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Natalie DESVIGNES

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Cordialement.
Best regards.

From: k.antonfeenstra@gmail.com on behalf of [Anton Feenstra](#)
To: NN-Consultation: allow-submission-to-berec@consultation.savetheinternet.eu
Subject: Importance of strong net neutrality
Date: 08 July 2016 11:06:00

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? It might seem alluring to many end users, who wouldn't want free 'Internet'. But it puts unprecedented and dangerous power into the hands of commercial isp's to bias or limit user's access to information.

My name/organisation:
Anton Feenstra

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Emergency services, or dedicated real time video connections. They need guaranteed throughput and/or connectivity, which internet doesn't give.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Yes, probably.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It may limit available bandwidth or resources to regular traffick. I.e., a second-rate Internet.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Imagine that each isp only gives (free) access to a part of the Internet, and that access to the rest becomes prohibitively expensive (to some or many). Some people would live in a 'Vodafone' world, others in 'tele2' world. Disney may become an isp just to offer such an 'experience'. I think this is very dangerous. Big brother 2.0.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not. If other connections need priority, it should fund it's own resources.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, severely so. This is an open door to commercial censorship.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Reasonable means my traffick will not ever be limited by priority traffick. Imagine a real time video steam being routed through my segment every time I was going to visit a porn site, or that of a certain political party?

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have

to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Anton Feenstra

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Nicol pora

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

Nicol Pora

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Patterns in behavior that intentionally result in the gain of profit.

There is a demand for zero rating, however, that is only because people perceive that they are getting something for free, which is not the case - therefore it should not be practiced. It also creates a bias market.

My name/organisation:
James Key

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management? Absolutely not. It's the same principle as going through someone's physical mail for the purpose of mail statistics/management.

What information would you like to receive about the speed of your Internet connection? The real, tested speed, not just the maximum potential.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes. They should be given as tested average values for recent similar connections around the same location on every piece of parameter.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the

optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. Hello everyone,

the Net needs to be neutral and equally accessible for everyone as a vital guarantor for freedom and peace. In my opinion there cannot be any short cuts, fast lanes or privileged areas for a few. We cannot keep sacrificing everything to the incentives of a few.

Kind Regards,
Sebastian

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Carlos Catucci

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
If the specialized service doesn't implemented at detriment of the free net, no problem. But if to offer specialised services to a couple of rich users (and companies) the band will be cut off for the normal use of the net, it's time to make a revolt.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Commercial practices are often annoying, especially spam in email or on the web pages (intrusive and obstructive banners and alerts), but there the SW solutions to that.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No! Is a fascim!

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
In no way. Already I must pay to have access, then I can do what I like, the ISP get the money to give me bandwidth, the use of it is my choice.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Yes, they're not philanthropist that donate the access for free, they want money to give it.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
No matter, no management of traffic is reasonable. A balance between bandwidth and number of user is natural, but without prioritize some user.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?
All the info's are needed

What information would you like to receive about the speed of your Internet connection?
A periodic report of daily average speed maybe a good thing. So I can compare with averages of other users that are connected to other ISP

and i can evaluate if it's a better choice to change ISP

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, all the details must be clearly indicated. So then I can make a decision about what ISP I like to join to.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet

access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines. There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter,

packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

EZLN ... Para Todos Todo ... Nada para nosotros

From: [Markov Bullmann](#)
To: [NN-Consultation](#)
Subject: Input to consultation on BEREC Net neutrality guidelines
Date: 10 June 2016 21:12:11

Dear Sir / Madam,

Would you please confirm that you have received my comment?

I agree with the publication of my comment.

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Zero rating leads to lower data packages, in the end "zero-rated" options lead to smaller packages and thus higher costs to end users. There is no free lunch. In the end the consumer pays.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are no consumer-relevant services which would require more than a "plain", but well dimensioned Internet access service. Some exotic services like "e-health" will always require separate infrastructure, such services are not related to Internet and they should not be confused with Internet. Thus there is no need for specialised services within the Internet domain.

Is there a demand for specialised services? Which services should be allowed this special treatment?

None.

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No. This would be a violation of the privacy directive (thus national privacy laws) and the upcoming data protection regulation. It also infringes the Charta of Fundamental Rights of the Union.

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

That's not their business. ISPs shall transport, not monitor/interfere etc with traffic.

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

Minimum speed, the only relevant figure. No traffic management, this is how the Internet is built.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an

open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

Kind regards,
Markov Bullmann

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Fundacja Terapia Homa

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services

by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Roberto B. org: Privata.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—

regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?
NO.

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
Complete privacy with no logs... I prefer freedom without being spied upon.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
?

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
All traffic created equally without discrimination is what is needed both now and in the future.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Yes. No examples needed. I pay for a speed and I want that speed to not be slowed down for profiteers sake.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
Absolutely not. Never. The USSR and other former 'states' had listening stations to monitor (spy upon) citizens and I don't want that again.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Never

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Yes.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
Reasonable is all traffic. Total anonymous data with no ip logs or mac address logs.

What information would you need to make an informed decision about your Internet

connection? For example: traffic management. commercial practices or technical conditions?

The exact details; however, no logs should be kept for internet traffic unless it is totally anonymous.

What information would you like to receive about the speed of your Internet connection? Nothing. I want what I pay for and I can get all I need from machine and download speeds.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

If the provider has issues, known issues, then, I suppose those should be stated.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in

line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be

assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Dr. Maarten Vasbinder

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees. Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service

capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3)

of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-

competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

It is vitally important to provide full access at any time, for everyone, also it will not work that way because users will find loopholes and workarounds.

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? all services should be included for equal use and to the gain of all customers small and big ones.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

every connection should be treated equally because there are communication ways aside of internet connections that can be already established for social security and rescue services, big corporations don't need to be prioritized because they already have an advantage moneywise and don't need extra support, it's rather the other way around, small businesses need to be promoted in order to restore balance to the market and make the market more stable through versatility.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Big Players already have all advantages they need because they have more advertising and better promotion through the loads of money they spend on it even if they don't need it, if they make a good product, seen on non advertising corporations that get promoted mouth to mouth, they spend money on making the best possible quality for a low price and are successful nonetheless.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples? even both, through cutting speed and availability you not only making poor people and small businesses poorer you also lose customers through limited moneyflow and boycott.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

yes it is and it should only be used on extremely dangerous organisations like warmongers and Murderous groups.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or deprioritise certain types of online traffic (video, P2P, etc)?

not at all.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

they should rather build bigger lanes so more traffic can be handled so there is no jams for anyone.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

reasonable would be to slow non vital connections in case of emergency like VOD services

What information would you need to make an informed decision about your Internet connection? For example:

traffic management, commercial practices or technical conditions?

I guess I would need to know when an internet traffic jam occurs, such as on Sundays so I can restrict my use of myself to the important data transfer, and restrain myself from unnecessary connections.

What information would you like to receive about the speed of your Internet connection?

Maybe there is a way to build a dynamic connection speed management that allows all users to use faster speeds whenever they are available and slows down all connections if too many users are online, so you get speed bumps on less trafficked periods and slower connections when there is much traffic to provide equal distribution for everyone.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Latency yes, maybe even offer an extra cost low latency service.

The rest of the service should always be as good as possible.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth

agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the

context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
Joseph eulberg

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Jesús Pumariega García

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? absolutely not. The people that knows about it (people who investigate, not the people that only see the side offered by providers) are all in accord: not to this shit!

My name/organisation:
Miguel

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
generally nothing useful to users, they only wanna more 0's on their bank accounts

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
nope (i think)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
only see north korea. I'ts a perfect example of the results of limiting the net.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
yes

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
never. if i'm looking for a panasonic's tv (in example) and sony have an contract whit my ISP (in example again) it can block my traffic and made me think that panasonic does not make tv's, but sony yes. Or can block possitive critics & reviews of panasonic tv's and negative critics of sony. And infinite etc's.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
0 looks reasonable

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
isp's must limit to grant internet to homes(or enterprises or others). Only that. No manage contents, no seek users, no do anithing more. We only pay for internet, how complicated is understand that?

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

i consider reasonable if the isp gives to police an area in extreme cases (terrorism, pederasts, hijack, etc). If i want to stole wifi from my neighbour, i must can. The security and legality of that, is my cuestion, and only mine

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

if i have all the info about all that i buy, better

What information would you like to receive about the speed of your Internet connection? all that can be provided in the context of the law. I pay for all, line and info about it

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

at the moment of the offer, they sould-must informate the client of all thing that includes that, with clear words and leaving technical terms. Obviously, nothing can pay an attorney to all new client, buy all can give some info about the product that is solding. Also, obviously again ever keep people that dont understand, but they will be infinitely minus if the corps care to inform the clients

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect

would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If

people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management

should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation

guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of

Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft

guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

Subject: Internet neutrality concerns
Date: 20 June 2016 11:08:13

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

Don't know. Anyway existence of demand doesn't mean it is a good thing to offer.

My name/organisation:

Roberto Serra, Università del Piemonte Orientale

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Remote firewall, a web interface from which to chose DNS, a proxy, a VPN for devices (eg: my wifi printer at home could be accessed from my phone wherever I am, this kind of service could be made easy for normal users as an additional ISP service)

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Don't think so.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Obviously a handful off huge companies will build a monopoly of traffic.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

In any way, if I am entitled to certain amount of data transfer it must be my only choice how to use it, be it one single file download or hours of navigation in text only websites.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, of course it would.

What information would you like to receive about the speed of your Internet connection?

Peek speed is misleading if it is the only figure provided, to a non-expert user it is the equivalent of a plain lie. Alla data should

be provided: peak speed, lowest registered speed, mean, median, average, per zone data, per time span data (to see if the service is stable, improving or worsening).

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

All available data should be offered to the user/customer to allow an informed choice.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU

Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued

functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Subject: Internet Neutrality
Date: 19 June 2016 10:37:45

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Birgit Hett

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
david mc laughlin

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes. The internet is the most prominent social-communication tool for rapidly disseminating ongoing events; if some applications are de-prioritised this would adversely affect our ability, as a society, to react to what's going on (eg. terrorist attacks, ongoing conflicts etc).

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

I would need to know the expected speed range for my area, the available tariffs, and the isp's procedures for traffic management in terms of what they consider priority and non-priority traffic (if any). I'd like to know how reliable the connection is, but i doubt that information is available. My current connection can go for a day or two without dropping, or it can disconnect several times in an evening.

What information would you like to receive about the speed of your Internet connection?
see above.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I don't believe isps can produce replicable, credible data like that; they would see it as not profitable to show areas where they don't perform so well. It would be nice to see what my isp expects me to have, but i know from both experience and the data from my router that the service i receive is highly unreliable in terms of stability and speed.

I believe that isps would simply do a small sample test of their areas and only publish the most favourable results; it's not in their commercial interest to publish poor findings.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information

freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the

performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Subject: Internet Neutrality
Date: 17 June 2016 17:14:00

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Paolo Fumich

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
VOIP is the only one coming to my mind.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Least possible

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Could facilitate ISPs in not investing in their network. Quicker networks are a gain for all citizens.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
I would allow traffic management only in very special congestion cases and only to keep fundamental real-time services up, such as VOIP

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?
I'd think the basics would be: Filtering and traffic management logics, commercial practices, minimum bandwidth, privacy (log retention policies)

What information would you like to receive about the speed of your Internet connection?
Minimum guaranteed bandwidth, average speed in my zone

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?
They should be listed in a table. Average geographical values

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be

ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or

severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are

misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Serge Brisset

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
the Internet service providers should treat all traffic equally, and not classify them

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised

services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower

(and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are

not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. [NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Dr. Ralf Ulrich, Karlsruhe Institute of Technology

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No. In the context of encrypted data this must not be possible.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Not at all. It can be an advantage if the end user himself can make such decisions, but this is easily possible with good routers.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Yes.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Jane Hanscomb BSc

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and

the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful

effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Mr J Falconer

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by

modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word “other” before “end-users” in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

“Zero-rating” is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get “free” access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that “National regulatory and other competent authorities should be empowered to intervene” and “should be required, as part of their monitoring and enforcement function, to intervene” only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the “consistent application of this Regulation” by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a

discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Hanne

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with

the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Date: 15 July 2016 00:36:46

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

From the end user's point of view, an ISP should function as a common carrier, transmitting the end user's data without any knowledge of content, and without regard to origin or destination. There are no legitimate exceptions other than national security, cyber crime, and local/regional national emergency.

My name/organisation:

Robert Jansen, independent inventor

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? The only legitimate "specialized" or "optimized" services that belong on the internet are certain national security applications. There is no legitimate basis for (privately run and owned) ISPs to have what amounts to the (not even thinly disguised) power to censor content (of which they are not even supposed to be aware).

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

If there is a need for optimized connections for health care or connected cars, put them on a separate, physically and electronically segregated band. If there is a sufficiently demonstrated need for optimized connections, this strongly indicates the need for separate bandwidth, not preferential treatment within an ostensibly transparent system. Otherwise, exceptions and preferences will become the name of the game and overwhelm what was once an open system, transforming it until it becomes unrecognizable.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

See comment above. Specialized services, if they are in fact legitimate, require segregated and isolated bandwidth.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

I have already noticed unreasonable delays in downloads that I cannot explain other than by hypothesizing (illegal) throttling on the part of my ISP.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

NO! Other than the irreducible minimum of data necessary for management of traffic flow (size of file, origin, and destination), monitoring, absent the issuance of a properly executed search warrant, monitoring of content should be a both a criminal offense and a tortious act.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

FIFO (first in, first out) should be the order of the day except for matters of national security, criminal investigation (accompanied by a warrant), or local/regional/national emergency.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

If time sensitivity is a concern to the ISP, then the ISP should improve the performance of its network, not try to place the burden of its incompetence on the backs of its users.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Real-time monitoring of traffic flow with an aim towards anticipating the need for future growth (and actually responding to that need by increasing bandwidth) is reasonable, and in fact both necessary and sufficient. Nothing more is required except as I have previously stated (i.e., national security/criminal activity/emergency).

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

The same disclosure required of common carriers should be imposed on ISPs. I should not have to anticipate what information I require. It should be freely available to me.

What information would you like to receive about the speed of your Internet connection?

I would like to be able to examine and analyze the performance of my ISP (and every one of its competitors) from end to end. Then and only then can I make a well-informed decision.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Not only should they be required to describe and disclose their technical performance, they should all be required to describe and disclose through a common format, so anyone who so desired could use a single, common method of statistical analysis to aid in this/her/its decision making.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations.

In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

Open access to the internet should be maintained. Practices that restrict this should not be permitted

My name/organisation:

James Grant

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

anticompetitive practices should be discouraged

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Specialised services should not be allowed to take over the internet

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Fast lane service should not be allowed to the detriment of other services

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

privacy rights should be strengthened, not eroded.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Prioritisation of particular types of online traffic could lead to a form of censorship

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Prioritisation of particular types of online traffic could lead to a form of censorship

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of

Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft

guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Subject: internet web neutrality
Date: 06 July 2016 12:29:17

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? The only desire or zero rating comes from companies seeking to skew the market in their favour. Since this is by nature anti competitive, it is contrary to the concept of web neutrality and contrary to the basic premises of the EU

My name/organisation:
Rob Newell Retired

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Only services where service interruption or slowness could endanger human life should be offered as specialised. For example, communications between emergency services. Even in these service, only these for which uninterrupted service is critical (i.e. actions which occur in real time and as a result depend on uninterrupted service for their safety and effectiveness) should be classed as specialised

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

In the case of e-medicine this demand is important and will continue to grow. It will particularly benefit those in isolated communities with limited or no access to in vivo medical services. However, following from my last comment, it is important to recognise that this should not be taken to include such matters as routine consultations, non-emergency care, communication of routine medical matters such as drug prescriptions, advertising by medical companies, medical research into non-emergency matters. None of these latter require a specialised service as they don't rely on uninterrupted data flow.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

The insensitive prioritising of specialised services implies the creation of a 2 tier internet and so is contrary to the concept of neutrality.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

See my answer above. Here in the UK, many people will remember when a single telephone company existed and had a monopoly not only on line rental and call pricing, but even the purchase of devices to be used (phones, answering machines, etc). The introduction of commercial practices which restrict consumer choice is an example of a similar situation.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. Such practices should only be allowed in very specific circumstances (e.g. prevention of terrorism prevention of racketeering), and in these situations the use of data monitoring should be overseen by the courts, not by a commercial organisation such as an ISP

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

People's definition of what is reasonable traffic management will differ and the practice is open to abuse where the provider is allow to make such judgements.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Again, 'reasonable' is open to interpretation. However, the wording is largely OK providing there is an adequate method of demonstrating that the characteristics of reasonability, transparency, etc are met.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

reasonable traffic management is the minimum management required to maintain a service, departure from this criterion is not intended in the relevant clause in the legislation.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

I Have not checked this. However, my experiences o trying to get any meaningful data from my ISP suggest that only external monitoring of their performance is likely to ensure my rights as a consumer,

What information would you like to receive about the speed of your Internet connection?

Graphic display available to me in real time

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

This question is badly worded and assumes for to much knowledge from me, and, I suspect, the average internet user. The further information available on the click button is no better. Naturally, information from ISPs should be expressed in lay terms (unlike this and some of the other questions in this survey, by the way), but this is often difficult to reconcile with the need for unambiguous legal language

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and

distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their

data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for

sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?
kommerzielle Praktiken interessieren mich nicht

My name/organisation:
Beate Kastner

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
nein

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
das Internet muss FREI bleiben

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
für mich ist das Internet privat und ohne Grenzen

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
das wäre eine Unverschämtheit - es funktioniert wunderbar, vor allem ohne "traffic management

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?
alles und vor allem so klar wie möglich

What information would you like to receive about the speed of your Internet connection?
kann ich selbst erhalten

How should ISPs describe other parameters of their Internet access offers, such as quality

of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?
alles muss klar dargelegt werden

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised

services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications,

but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Steve Shepherd

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to

be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Peter Higgins - Private individual

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with

the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

To whom it may concern,
No company should monopolize the Internet, it should remain as it is.
It was designed for all to enjoy and benefit, not just for large organisations to be greedy with.

Kind regards

From an ordinary member of the public

I herewith demand to preserve a democratic Internet with equal possibilities and chances for every user without privileges for some Groups, Companies or Persons. Defininations like "Special Services" should be limited to a few, strictly non commercial services. There shouldn´t be a system of different data handling. In a free world, the access to data shouldn´t be depending on groups or companies.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Mazen Sukkar

Founder

Skunk Amazer

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity,

separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring

paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

I don't think there is a demand

My name/organisation:

Brian Taylor

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Whilst the NHS Spine must be protected at all cost from hacking, etc. I can think of no reason for any other service that should not be on the open internet.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

As above, apart from NHS there is no justification for a company to 'cordon off' a portion of internet access for its own services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I see no positive impact, only negative, at least from the consumer's point of view. The net would quickly become a nightmare of inaccessible websites, unusable services and people would either have to fork out ever increasing amounts to use it or just stop using it except when absolutely essential.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Yes I do. For example a search engine could offer an ISP money to encourage all users through that search engine by reducing speed when a user tries to use a different one.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No!

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc.)?

Apart from gaming (and I am not a gamer) I do not see a reason for prioritising traffic.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Quality and speed should remain consistent regardless of the type of content being accessed. ISPs cannot manage traffic in a way which would block, alter, slow or throttle access to any specific application, service or content. In short, discrimination should not be allowed.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples. Reasonable management would be when the internet is overladen and so it should be managed so everyone can use it to some extent. Unreasonable would be to stop access to some content in favour of others. I would not be happy if I was trying to pay a bill online and the page timed out because of traffic management.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions? I think the information is fairly clear though whether it is what they practice is another matter.

What information would you like to receive about the speed of your Internet connection? I have not had a problem with this since you get an estimate based on your line which is usually fairly accurate.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I have insufficient knowledge of this area to make a comment

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to

circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National

Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those

conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
John-Vernon Baer, Rentner

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of

Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?
http: all connections should always be free.

https: connections where the ISP is not involved in the security should always be free.
ISP's should get their earnings only from the technical services they provide. They should NOT be allowed to take money from FaceBook and others to somehow plug those services. ISP's should be treated like water suppliers. It's up to the consumer if they want to drink the water, shower or play with the kids in the garden.

My name/organisation:
r muller

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

There should be a feature or a user's choice to dramatically slow down the upload speed (to only a few bytes per second) if the user wishes to prevent hackers from stealing large amounts of data. With upload speed turned down, it would take ages for a screen capture jpg of a bank payment to leave my computer. For normal internet browsing the upload speed isn't really important. What I propose is a bit like 'Flight' mode, but without stopping access to the internet.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Of course there is and will be a demand for specialised services. Just looking at what it takes to see or interact with a GP makes it blatantly obvious. With good (and secure)connections and a bit of smart software a GP should be able to properly see many more patients than now, without the need for the current secretarial entourage . The paper shifting should stop.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

There are many positive and negative impacts imaginable. Access to the open Internet

should be guaranteed and ISP's should NOT be allowed to by themselves offer 'specialised services'. Specialised services providers should have a different legal entity from the ISP and they should buy whatever capacity they need from an ISP

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

The internet and the equipment to access it is already full of undesirable commercial practices. I just bought an Acer laptop. McAfee probably paid Acer to be allowed to load their 3 months free starter software on it. They actually Block Microsoft's Defender from being accessed in any way. The laptop comes with all kind of games, links and even an offer to synchronise all my data with some cyber server in China. Without software like PCdecrapify, I'd be manipulated into an insecure and costly internet environment. It's the same with smartphones and smart phone internet packages. They all try to manipulate the consumers.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. ISP's should be treated as utility suppliers.

There is already an NSA and a GCHQ, we don't need ISP's to become Stazi agents.

Of course to comply with government orders to block access to certain IP addresses or websites, there should be a software system in place for ALL ISP's to adhere to the rules set by the Government of the day. Technically ISPs should not have to 'manage' such system. The management of it should be done by the Courts or GCHQ

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

It's probably unavoidable that there will be some squeezing here and there. The one who pays the bill (in old terms the 'Pater Familias') should be setting the priorities. Let's say he or she must allocate 10 points to whatever they want. For me that would be http: 3 https:2 video:2 p2p:1.

The ISP should feed my wishes into their software, and all the clients together would have set the squeezing program to whatever they want. Perhaps more difficult than the more crude methods that are in place now, but it would be far more democratic.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

It all depends on the integrity of the ISP. In the UK my experience is with Virgin and they are reasonably good. In the far east I have had to switch ISPs again and again, because they all squeeze to the point that I can't even get to my email at certain times. As long as there will be a good code of conduct imposed to ISPs in general, the European mentality is that they will want to provide a decent service,

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide

examples.

If ISPs squeeze international traffic in favour of domestic traffic, it can easily grind things like email or banking completely to a halt. If on top of that they would own some of the data traffic it's a recipe for unfair treatment. For example I could imagine that Sky ISP, having the rights to a world cup match, would rather see Netflix crash, rather than their own branded traffic.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

ISPs should be governed like the Stock Exchange. No insider trading allowed. The EC should be able to ask ALL ISPs to provide data in a standard format, set by the EC.

What information would you like to receive about the speed of your Internet connection? It's like VW's MOT tests. I know the speed I get from my ISP is 'crap', but when I go to any speed checker, miraculously the speed goes up immediately.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

There should be a minimal standard to which each ISP must adhere. That standard should be set either for a single user, or for a standard family. For a single user, the standard should be more or less flawless. Where families share 1 subscription, as things are they can't have perfect video, P2p, Skype, Viber, Line all at the same time. In due course however, one may expect ISPs to ask how the bill payer would like to see squeezing -if any- has to be done. If I pay the bill and I want to watch Netflix, then I want my ISP to know I go first and P2P can wait.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification

to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and

the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration. Amongst the 'standard' text derived from the questionnaire I completed in order to generate this email you will find some views and statements which are entirely my own - please therefore read it carefully before consigning it to the recycle-bin! (To facilitate your reading I have used [Navy](#) ink for my own replies/comments..)

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

I'm sure the big companies must love the idea that paying premium-prices for their own internet access can effectively stymie the efforts of their smaller competitors to place their goods and services before the wider public. The temptation to go to the web-site at the the top of any list provided by a search engine is almost irresistible.

My name/organisation:
Robert Milne

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? [Censorship \(for purposes of child-protection and perhaps prevention of other crimes - terrorism being high on the list but less toxic forms of dissent being montored 'just in case'\)](#).

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

[Remote control of certain domestic appliances - home-security and heating systems, entertainment centres, perhaps even coffee makers!](#)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

[Malicious use of some services without fear of detection and prosecution could possibly encourage mischief-makers \(as distinct from hard-core hackers, including fraudsters and terrorists, who will do it anyway\) to cause mayhem just for the fun of it. On the positive side, sales of firewalls and other security systems would rise and we'd all become much more aware of the need to use passwords stronger than "Password001".](#)

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

In a free and fair market place no commercial organisation should be able to 'buy' preferential access to any form of infrastructure, be that the postal service, the road network, energy supplies or the internet. It follows that these so-called 'commercial practices' are ultimately a barrier to the single market. The Council would appear to have a duty under article 26.3 of the Treaty on European Union to prevent such practices.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. It seems to me that such a measure is bound to involve an element of delay; the packet-switching system is designed to ensure that bundles of data travelling by separate routes arrive at their joint destination in a timely manner for re-integration as a coherent stream of information. Inspecting individual packages could interfere with that process and thus introduce errors and delays. Even if it doesn't, there's still a little too much of the "Big Brother is Watching You" about it. Furthermore, it seems like a disguise, a device to conceal the mechanism of censorship behind the mask of network efficiency.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

I'm all for stopping the children from wasting their lives watching fatuous pop-videos and posting narcissistic 'selfies' on inane 'social media' but that is probably better accomplished by educating them to have better taste. The problem with allowing ISPs to do this through prioritisation or its converse is that they (or more likely the algorithm underlying their software) will become the arbiters of - effectively - good (and bad!) taste. Can anyone guarantee that neural-net-based AI won't develop fascist tendencies?

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Probably not, but this isn't just about me - we have to look at the bigger picture and see the implications for free trade, free speech and non-discriminatory allocation of resources by all suppliers.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Slowing down my email to the editor of (e.g.) New Scientist to allow faster passage of advertisements for internet-connected furry dice (an invention for which the world must now be ready: patent to be applied for once I close this questionnaire) would in my view constitute an unreasonable traffic-management measure. On the other hand, some things are (perhaps) even more important than said emails - tracking availability of human organs for transplant, perhaps - and a case can be made for prioritising these. That, however, should be done openly and transparently with built-in procedures for objective and impartial scrutiny, as happens in other areas - town planning, for example - where the rights of the individual must be weighed against the needs of wider society.

What information would you need to make an informed decision about your

Internet connection? For example: traffic management. commercial practices or technical conditions?

All ISPs should be bound by the same rules on commercial practices/traffic-management, and if we can achieve that then only factors such as speed, cost and reliability will determine my choice.

What information would you like to receive about the speed of your Internet connection?

Speed, cost, reliability (Being cynical though, I wouldn't necessarily expect truthful answers to my questions concerning even those fundamentals let alone in relation to more sensitive topics such as those under discussion here.)

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Few people would understand terms like "latency, jitter [and] packet loss" so employing them could be construed as an attempt to blind the customer with science. Perhaps consumer organisations should be encouraged to award blobs/stars for technical merit and thus provide a more user-friendly guide to ISP competence, whilst ensuring that the numbers underpinning their judgements are available to those sufficiently interested and competent to make use of them.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase

market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to

intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this

approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
Robert Milne

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Steve Rockcliffe

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Subject: Just another stakeholder comment regarding the BEREC net neutrality guidelines for your consideration
Date: 28 June 2016 18:31:21

Dear Madam or Sir,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name is Jens Buthe (38y, Germany).

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? I'm praying to God that whenever I'm in need to get in touch with e-health that it's provided by a dedicated line, instead of sharing the line with other stuff, optimized or not, ...

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

In my eyes there's no preferential treatment without discrimination, like light and shadow.
As soon as there's a payed fast lane, the ISPs have the need to create incentive to sell them.
This incentive is usually causing discrimination.

In addition, privacy has a high value for me!

Using a specific service presupposes that my ISP has to sniff through all my traffic, identifying if it's specialised or not, who could want that?

On the other side, if they have to sniff all my traffic, what about encrypted connections?

What about my VPN connection? What about my https connections?

Are encrypted and therefor unidentified connections by default on the "slow lane"?

Would I have to send my traffic unencrypted to be able to use a fast line?

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Privacy has a high value for me!

Not paying for a specific service presupposes that my ISP has to sniff through all my traffic, identifying if it's for free or not.

Usually, if I'm not paying for something I'm not the customer but the product.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

The content of my conversation/phonecalls is none of the telephone providers business, why should it be different for the ISP and the content of my traffic?

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

It's hard to judge if there's something like good traffic or bad traffic!

e.g. The words P2P or FileSharing are usually used as if this techniques were limited to illegal actions only and therefor has to be de-prioritised or blocked, ignoring that a whole lot of (e.g. software) update or (e.g. podcast) distribution functionalities are based on this protocols.

In addition, the ISP shouldn't sell a line with a dedicated capacity if they're unable to provide it.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Traffic management should be an exception in "emergency" situations, but not the every day rule.

In addition who shall judge which protocols / data in good or bad / important or unimportant, the ISP?

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Reasonable traffic management kicks in, when an emergency / extreme situation occurs.

If there's an accident on the highway, it's fine to block the road for all users.

If there's no accident there shouldn't be any blocking for anybody.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

Usually there's a clear definition missing.

What's "file sharing"?

Is it port related, protocol related, content related?

How can I verify if and/or why I have been throttled?

What's happening to traffic that cannot be reated due to encryption?

In addition a font size >4 would be helping as well, ...

What information would you like to receive about the speed of your Internet connection?

A realistic number would be appreciated.

Please leave me alone with "up to ...".

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access

services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Thanks for reading and regards,
Jens Buthe

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Luca Salvadori - Milano, Italy
Freelance IT Consultant

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They

cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is

logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear members of the commission,

please ensure in the final regulation that discriminatory practices as zero-rating or preferred traffic for certain services with commercial value will not be possible. Of course, services in the public interest (like telemedicine services) can be preferred, but no ISP should have the possibility to let customers pay extra for advantageous traffic.

Yours sincerely,
Ralph Heinz

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Dr. J. Michael Fried, University of Nuremberg-Erlangen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They

cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is

logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Subject: keep the internet neutral
Date: 18 June 2016 10:06:15

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

if the service where zero-rating is included in the price of the internet access (cloud storage for example) then it is fair. Otherwise it shouldn't be allowed.

My name/organisation:
Laurent Liou

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
none

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
if voice and video streaming can be delivered over the internet, I don't see what other service would need an optimized connection

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
This could only increase inequality, cause some companies to secure for themselves exclusive access to some resources

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
if my ISP offers me zero-rating for one video on demand service and not for another one, then I will be strongly influenced in my choice of VoD provider. This will create the formation of cartels.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
only if it everyone benefits from it (offload purpose). Not if one specific service benefits from it.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
If some applications have to deal with real time (voice streaming), I can understand some moderate prioritization.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
if it has an impact on any user's experience.

What would you consider to be "reasonable" traffic management measures?
How can "unreasonable" traffic management measures affect you as a user?
Please, provide examples.
reasonable is if the experience of other user is not impacted.
Unreasonable would be if streaming the football cup reduces the access
to e-commerce web-pages.

What information would you need to make an informed decision about your
Internet connection? For example: traffic management. commercial
practices or technical conditions?
all three.

What information would you like to receive about the speed of your
Internet connection?
theoretical bandwidth, average bandwidth over every subscriber in
practice (by time of the day), my own bandwidth in practice (by time of
the day).

How should ISPs describe other parameters of their Internet access
offers, such as quality of service parameters (typically latency,
jitter, packet loss) and quality as perceived by end users? Should these
parameters be defined in the contract? If so, how?
the contract should offer a minimum QoS and send the averaged measured
value over one month

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low
cost of innovation and low barriers to entry. These principles ensure
that every established business, start-up or non-commercial
service—regardless of their size—has an equal opportunity to communicate
with a global audience in a manner equal to their competitors. This
driving force for the prosperity and diversity of the online economy can
only be ensured by an open, neutral and non-discriminatory Internet.
When internet providers are allowed to interfere with the decisions of
their customers by economic or technical discrimination, this freedom is
lost. Recital 1 of the EU Regulation on net neutrality says that
legislation has to be interpreted in a way that ensures our freedom to
access and distribute information and that protects the Internet as an
engine for innovation.

The current BEREC guidelines create a solid foundation for the
protection of these principles. The enormous task BEREC was left with by
the legislator has been fulfilled in a balanced and careful manner that
ensures the protection of the rights of consumers and businesses
guaranteed by the regulation. The guidelines provide much needed
clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services
("services other than internet access services") under strict
safeguards. Article 3(5) and Recital 16 require the optimisation of
specialised services to be objectively necessary for the functionality
of key features of the service. This would not be the case with services
that could also function on the open, best-effort Internet. Furthermore,
Recital 16 prevents specialised services from being used to circumvent
general net neutrality traffic management rules. Any deviation from
these safeguards that would widen the applicability of the concept of
specialised services would increase market entry barriers and thus
weaken the innovative potential of the Internet as a whole.
If ISPs are allowed to charge online services for preferential
treatment, they have an incentive to stop investing in network capacity

for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic

management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Subject: Keep the internet open.
Date: 13 July 2016 11:18:41

Dear Sir or Madam,

I petition you to take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

"Commercial practices" such as zero-rating, are a bad idea. They will skew usage and access to information in a way that is commercial, rather than unrestricted. This limits consumer choice. All internet traffic should be treated in the same way.

No "optimised services" should be allowed to be offered. All traffic should be treated equally.

Internet traffic should not be categorised. All traffic should be treated equally, otherwise competition will be stifled.

"Specialised services" will impede open competition for users of the internet.

"Specialised services" offer no positive features for the users of the internet. All services should be treated equally.

Users rights to freedom of communication need to be upheld. If I choose to communicate by VOIP or SMS rather than my landline or mobile, I should be free to do so. Traffic related to certain services should never be throttled or blocked for commercial reasons.

ISPs should NEVER be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection), and I consider it outrageous that this is even being considered.

Any traffic I generate is personal to me, and monitoring of it is an invasion of my right to privacy.

My ISP should not be able to prioritise or throttle any of my internet traffic based on what it might think I am using that data for. All traffic should be treated equally at all times.

Discrimination based of traffic purpose or content should not be allowed. If the network is busy at certain times of day, then so be it. Different types of traffic should all be routed with equal priority at all times. If network congestion is a continuing problem then the network will need to be upgraded.

"Reasonable" traffic management would be to allow ALL traffic to be EQUALLY slowed during times of network congestion. This is the same as happens with road traffic.

ISPs should make it very clear if they wish to implement "traffic management" based of traffic content or purpose. If my ISP started doing this, I would change to one that did not. There should be NO penalties for abandoning a contract early because of the introduction of "traffic management."

The speed my ISP quotes should honestly reflect the AVERAGE (over 1

week, say) speed available at my location. It should never be the 'maximum generally available'.

ISPs should provide clear information about the quality of their service (latency, packet loss etc.) in addition to the average speed they are offering.

Yours sincerely,

Michael Ashby

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation

guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of

Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft

guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Maßnahmen zum Zugang zum offenen Internet
Date: 15 July 2016 09:12:01

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Peter Kopshoff
Freelancer

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with

their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute

information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter,

packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Subject: Kommentar über die BEREC-Richtlinien zur Netzneutralität
Date: 13 June 2016 21:48:31

Sehr geehrte Damen und Herren,

Bitte beachten Sie diesen Stakeholder Kommentar über die BEREC Richtlinien zur Netzneutralität.

Gibt es einen Bedarf für "kommerzielle Praktiken", wie zum Beispiel Zero-Rating? Könnten diese Praktiken deine Rechte als Endverbraucher beschränken? Bitte gib ein oder mehrere Beispiele. Ich sehe keinen Bedarf und möchte alle Dienste gleichrangig nutzen können. Eine Privilegien für einzelne Dienste lehne ich ab.

Gibt es einen Bedarf für Spezialdienste? Welche Dienste sollten diese Sonderstellung bekommen? Für Streaming und Internettelefonie kann es sinnvoll sein, die Übertragung z.B. gegenüber Download zu priorisieren. Dabei muß der Provider aber sicherstellen, daß die anderen Übertragungskanäle genügen Kapazität zur Verfügung steht, um Benachteiligungen anderer Übertragungsarten zu vermeiden.

Was könnten positive und negative Einflüsse von Spezialdiensten für die zukünftige Offenheit und Innovation des Internet bedeuten? Finanzstarke Firmen können sich eine bevorzugte Übertragung ihrer Dienste kaufen und somit andere Firmen, Vereine und Privatpersonen benachteiligen und damit auch ihrer Stellung zementieren.

Welche Informationen möchtest du über deinen bestehenden Internetanschluss bekommen (z.B. Geschwindigkeit, Quality-of-Service oder Traffic-Management)? Mich interessieren neben der Geschwindigkeit auch die Einstellungen für QoS und Traffic Management.

Soll der Internet-Provider deinen Datenverkehr überwachen dürfen, einschließlich der Inhalte (z.B. durch Deep-Packet-Inspection), um so den allgemeinen Datenverkehr besser managen zu können? Nein. Jede Art von Überwachung meines Datenverkehrs lehne ich ab,

Wie weit sollte dein Internet-Provider deinen Internet-Anschluss beeinflussen können - zum Beispiel um bestimmte Datenübertragungen zu drosseln oder zu bevorzugen (Video, P2P usw)? Nein, mein Provider bekommt von mir Geld, damit er mir einen unzensurierten und für alle Dienste gleichermaßen nutzbaren Zugang vor Verfügung stellt. Die Priorisierung des Datenverkehrs ist meine Angelegenheit und nicht die meines Providers

Die Regeln erlauben Spezialdienste nur unter ganz genau definierten Vorbehalten. Artikel 3(5) und Präambel 16 formulieren, dass die Optimierung der technischen Transferleistung nur dann erfolgen darf, wenn objektiv grundlegende Bestandteile des Angebotes sonst nicht möglich wären. Das kann nicht der Fall sein, wenn solche Dienste auch auf dem normalen, offenen, bestmöglichem (Best Effort) Internet-Angebot funktionieren. Präambel 16 legt darüber hinaus auch fest, dass Spezialdienste nicht zur Umgehung der technischen Regeln für die allgemeine Netzneutralität verwendet werden dürfen. Jede Abweichung von diesem Prinzip würde unweigerlich den Marktzugang zusätzlich erschweren und so das innovative Potential des gesamten Internets schwächen.

Die Regulierung beinhaltet genaue Regelungen, was "zumutbares Regeln des Datenverkehrs" ist. Laut Artikel 3(3) muss die gesamte Regelung des Datenverkehrs so neutral wie nur möglich erfolgen. Klassenbasierte Datenverkehrsregelung (Class-based Traffic Management) hindert den freien Wettbewerb, es könnte möglicherweise bestimmte Anwendungen behindern oder sie beschädigen, es könnte den verschlüsselten Datenverkehr stören, es schafft Unsicherheit bei der Vermittlung von Inhalten durch Anwendungen oder Dienste-Anbieter, es behindert Innovation, es kann einzelnen Nutzern schaden und kann zu regulatorischer Überlastung führen. Daher ist die Anwendung von klassenbasierten Datenmanagement dort, wo nicht-wertendes Datenmanagement ausreichen würde, weder notwendig noch den Verhältnissen entsprechend, es ist diskriminierend und intransparent für den Anwender.

Wenn Internet-Provider für die bevorzugende Behandlung von Daten Geld verlangen dürfen, ist das ein zusätzlicher Anreiz, in die Infrastruktur des "normalen" Internet weniger zu investieren und ihre Kapazitäten nicht zu erweitern, damit möglichst viele Kunden auf Spezialdienste umsteigen. Das ist besonders für Minderheiten ein Nachteil, aber auch für Menschen mit Behinderungen sowie für Startups, die sich diesen besonderen Zugang zu all den Netzen, in denen sie ihre Kunden erreichen wollen, nicht leisten können. Es schädigt so die Entwicklung eines freien, offenen und innovativen Internet-Ecosystem.

Kommerzielle Diskriminierung (Zero-Rating) beeinträchtigt mein Recht nach Artikel 3(1) über freien Zugriff und im Besonderen über freie Verteilung von Information. Wenn ein Internet-Provider einzelne Lieferanten von Inhalten, Anwendungen und Diensten via Internet diskriminiert, indem er den Zugang jeweils verschieden regelt, ist dies ein willkürlicher Eingriff in die Essenz meiner Rechte. Außerdem beschränkt es mein Recht unter der Grundrechts-Charta nach Artikel 11, 15(2) und 16. Deshalb darf eine kommerzielle Diskriminierung in den BEREC Regulierungen nicht zulässig sein.

Transparenz, so wie es die Kommission in ihrem ersten, mittlerweile abgelehnten, Entwurf der Regulierung vorschlägt, kann per se kein Gegenmittel gegen wettbewerbswidriges Verhalten sein. Transparenz kann, besonders in diesem Zusammenhang, nicht alle anstehenden Probleme lösen.

Diversität und innovative Fähigkeit des Ecosystems Internet beruhen auf geringen Kosten bei der Innovation und niedrigen Hürden beim Marktzugang. Das garantiert, dass jedes Unternehmen, sei es ein Startup oder ein nicht-kommerzielles Unternehmen, egal wie klein oder wie kapitalstark, das Potential hat, ein globales Publikum zu erreichen, das ebenso groß ist wie das der Konkurrenz. Diese treibende Kraft für wirtschaftlichen Erfolg und Diversität kann nur durch ein offenes, neutrales und nicht diskriminierendes Internet garantiert werden. Wenn Internet-Provider die Entscheidungen ihrer Kunden durch technisch oder ökonomisch begründete Diskriminierung beeinflussen, geht diese grundsätzliche Freiheit verloren. Laut der ersten Präambel zur Regelung der Netzneutralität müssen alle gesetzlichen Regelungen im Licht diese Ziele beurteilt und interpretiert werden.

mit freundlichen Grüßen,
Carsten Grohmann

Subject: Kommentar zur Regulierung der Netzneutralitaet
Date: 15 July 2016 17:12:11
Attachments: [signature.asc](#)

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

Das Grundprinzip des Datentransportes im Internet ist bisher "best-effort", also so schnell wie möglich ohne Ansehen des Inhaltes oder Ursprungs der Daten. Für ein freies Internet sollten also allein Kriterien, die dieses Prinzip achten, für die Gestaltung der Geschäftsbeziehungen zwischen Netzbetreibern und -nutzern zulässig sein.

My name/organisation:

Juergen Schwarz, 63179 Obertshausen

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

My understanding in english is much better than expressing my opinion, so i will answer in german.

Für mich wären gesundheitsbezogene Dienste wie z.B. verbindungsichere und ausreichend leistungsfähige Datenverbindungen für Operationen bzw. Operationsassistentz denkbar. Fernsteuerungs- bzw. Assistentzsysteme für Verkehrsmittel wären auch eine denkbare Anwendung, sollten aus meiner Sicht aber hauptsächlich für Gemeinschaftsverkehrsmittel statt Individualverkehr zur Verfügung stehen.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Ich denke, ja (siehe oben).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Als negativen Aspekt spezialisierter Dienste, die in Verbindung mit einem Internetanschluss angeboten werden, sehe ich die Verfestigung des immer noch starken Stadt-Land-Gefälles in der Netzversorgung, da auch die Nutzer spezialisierter Dienste sich im städtischen Raum bündeln werden. Hier wäre auf die Sicherstellung einer angemessenen Grundversorgung zu achten.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Ähnlich wie im Bereich von Bürosoftware-Paketen oder messaging-Apps sehe ich die Gefahr der Bildung von Quasi-Standards auf der Grundlage einzelner Anbieter mit hohem Marktanteil, die in der Konsequenz zu einer Beteiligung am entsprechenden Produkt bzw. Angebot "zwingen", um im Austausch bleiben zu können. Und wie dort wird es schwierig sein, diese Marktmachtkonzentrationen erst hinterher, also nach deren Entstehen

anzugehen. Von daher sollte man die Entstehung solcher Konzentrationen durch Angebotspakete nicht auch noch erleichtern bzw. sogar fördern.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Nein. Ausserdem ist eine Diskriminierung verschlüsselter Kommunikation zu befürchten, da diese nicht eindeutig zuzuordnen wäre - und das würde dem eigentlich sinnvollen und wünschenswerten Zuwachs verschlüsselter Kommunikation (z.B. im Bereich email) entgegenlaufen.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Gar nicht.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Ja, ich denke schon. Wie soll Diskriminierung ohne Ansehen des Inhaltes oder der Herkunft der Daten funktionieren?

What would you consider to be "reasonable" traffic management measures?

How can "unreasonable" traffic management measures affect you as a user?

Please, provide examples.

Begründetes Verkehrsmanagement wäre für mich gegeben, wenn damit der sonst eintretende Zusammenbruch der Verbindungen verhindert würde.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

Datenübertragungsrate, Bindung an Endgeräte vs. freie Endgerätewahl, Preis, Angaben zu Art und Umfang evtl. Datenverkehrsmanagements,

What information would you like to receive about the speed of your Internet connection?

Angaben zur tatsächlichen mittleren Datenübertragungsrate, die mögliche Höchstgeschwindigkeit der Verbindung, aber auch die zugesicherte Mindestgeschwindigkeit.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Die Angaben sollten nicht allein in technisch messbaren Größen erfolgen, sondern auch anhand praktischer Anwendungsszenarien erläutert und eingestuft werden (z.B. anhand der möglichen Parallelnutzung in Familien: IPTefonie, Onlienbankink, surfen und gaming gleichzeitig)

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an

engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines

and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”.

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every

deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Hallo, liebe EU.

Ich finde es eine sehr schlechte Idee, dass ISPs den Netzverkehr selektieren und alle, die weniger bezahlen, eventuell weniger schnell im Netz vorankommen.

Auch die Idee, dass Firmen Kooperationen gegen andere bilden und nur Netzverkehr der Mitbewerber bezahlt werden muss, ist gegen mein Verständnis eines freien Markts.

Wenn die Netze gebaut werden, dann für alle!

Mit freundlichen Grüßen
Thilo Brai, München

BEREC Regulators

Please help making sure that the telcos and the ISP:s compete on a level playingfield with price, availability and bandwidth as the means for competition and not be allowed to use subsidized content since this limits the human development.

Sincerely,

Fredrik Larsson

A main argument of people voting for Great Britain leaving the European Union was the impression, that Brussel is even more than London or Washington ruled by lobbyists. This leads to laws which help large cooperations and protect their markets from competitors. Large cooperations are often among the least innovative organizations. This is especially true for telecommunication cooperations, which tend to form and protect monopolies.

Net neutrality is a strong way to prevent the formation of a monopoly by giving everybody equal access. If the European lawmakers fail to protect it, innovation in the EU will suffer and more countries will find arguments to leave the EU as well. Thus, net neutrality is in the very own interest of European lawmakers, as when removed, it will be another small step to the dissolution of the EU.

Regards
Stefan Harjes

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Javier Cabeza

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Fernando Rodriguez, SerInformaticos

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Jan Steglich

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
Jan Steglich

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Enn Matsoo

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere

with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic

management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

No average consumer has the time to read critically the 43-pages of draft guidelines. However, the media is rightly urging users to contribute to the discussion. Please ensure that the guidelines are implemented in a strict fashion. The possibility of "priority lanes" on the internet, (some data being processed before other) would considerably hurt the internet's ability to spur innovation.

Kind regards

SO

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
brian holland

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6.

July 2015, the legislator decided to delete the word “other” before “end-users” in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

“Zero-rating” is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get “free” access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that “National regulatory and other competent authorities should be empowered to intervene” and “should be required, as part of their monitoring and enforcement function, to intervene” only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the “consistent application of this Regulation” by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to

conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it

is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against

encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left

with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups

that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees. Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation

(on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely.

When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of

commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities

have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the “consistent application of this Regulation” by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management.

According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-

discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Christopher Czerny

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Stefan Drazkowski

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? no demand for the end users, this commercial practices are for corporate. It help them to understand our usage of internet and services. Those corporate can create services and sell them to others corporate.

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

users should use internet the way they want, isp can't choose for users. No specialised services could justify a difference.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

there are new usage of internet since few years but we can't deny some of them for others

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

positive : specialised service will be better

negative : users will focus on 3 or 4 services and forget all other possibilities. development of new technologies and services will slow down

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

isp should monitor the traffic to prevent a breakdown (and administrative management) but use something like deep packet inspection limit our rights. Users have the right to do what they want and access to website all over the world

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

The EU Regulation requires Internet service providers to treat all traffic equally : But in France some ISP limit the usage of Youtube for exemple... So ISP already interfere with our internet connection.

It's not their job to prioritise, users should use their connection the way they want. Users pay to access Internet not some services on internet

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

for prevent breakdown isp should manage traffic on their network (administrative management, router management, technical issue...), users freedom won't be limited on this case only

What information would you like to receive about the speed of your Internet connection?

Some explanation when isp have breakdown

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

They should describe quality of service parameters (typically latency, jitter, packet loss) before someone would subscribe. For my exemple my isp sell me an ftth access but we have a lot of packet loss so our connection is really unstable. If I knew their QoS I had choose another connexion

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services

by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

From: [Ruairi Carroll](#)
To: [NN-Consultation: allow-submission-to-berec@consultation.savetheinternet.eu](#)
Date: 15 July 2016 14:50:07

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Well, any financial benefit to the user is going to be adopted without question. So there is a demand. Just like there was a demand for faster horses before the car came along.

My name/organisation:
Ruairi Carroll/Klarna.

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
ISPs do not exist to do value-add, ISPs should deliver bits only.

We do not have value added services to our electricity, to our water. We expect power from the wall and water from the tap.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
No

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
Services drive traffic. Traffic is the metered service ISPs offer, so it's in their own best interest to be able to deliver ALL services across their pipes equally, to gain the benefit of openness.

The path forward is not with throttling some services, the path forward for ISPs is to stop flat rate access fees and move to a metered service model.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Yes, and no.

The issue we have at play is because people are treating the internet as a state sponsored service (like water, power, roads etc). It absolutely is not, it's a group of commercial organisations. Thus I have no rights, only what is agreed upon in ToS.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
Absolutely yes. Monitoring exists to stop congestion and do correct traffic planning. This

is essential to the correct operation of an ISP.

However this data should not be used to give unfair advantages to certain actors over others.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)? All traffic should be treated equally. If I cause congestion on myself, that is my fault.

It's like using a tap. If I open it too much and overflow my cup, that's my own fault, not the water company's.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

No

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Unreasonable traffic management is to ISPs refusing to peer directly with content creators or providers.

Reasonable traffic management is ISPs having multiple paths to content providers and creators, and picking the paths which best suit their business model.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

A deep technical understanding of BGP, as well as an understanding of how they're connected to the outside world, their peering policies (ie: open, restrictive, selective, ratio dependent), what level of oversubscription they run at, future expansion plans, platforms, QoS/CoS policies and what caches they have on-net.

What information would you like to receive about the speed of your Internet connection? "Speed" in terms of a home internet connection is meaningless. I need to understand oversubscription ratios to transit/peerings and on-net cache boxes.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

The mechanism for this already exists in business grade ISP contracts. Defining and measuring jitter across - literally - trillions of packets a day is not a task that can be done, nor will it ever be financially viable.

ISPs should state oversubscription ratios, as well as providing a clue at how hot their transit and peering links are running.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are

allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their

data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Dear Sir or ,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My organisation:
Bäckerei Steffen Schmitt

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency. In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

From: [David Robbie](#)
To: [NN-Consultation](#)
Date: 15 July 2016 14:09:44

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

Zero rating is another name for exploiting bandwidth prioritised to paid for subscription information. Detrimental to consumers who must have equal access to all providers of information and resources if the free scope and wide ranging network of human innovation is to be supported.

My name/organisation:

David Robbie

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

My opinion is that an exception may be made for e-health where this support for actual surgical or emergency hospital practice that may use internet channels. This could be allowed to prioritise over other kinds of network traffic but not general health services as such which should not be given any exception in terms of priority. Perhaps also other emergency connections as well. Although not "security" such as spying or checking on individual people.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

See my previous point. A service supporting the emergency support to health might be permitted. I cannot see reasonable cause for any others.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

In any circumstance where part of internet bandwidth can be exploited for specialised commercial services will be detrimental to the best use of the internet as a location for sharing the best of our individual endeavour and curiosity.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

They could limit my access to all possible providers by default sending me prioritised information from their "zero point" suppliers which the end user would find it hard to identify and detect not noticing that their full access had been limited by these auto-delivery services. Any service where information arrives to me prioritised makes it harder to identify or reach different or diverse sources of information.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Although I can foresee circumstances when resources are more limited where this might be a step that could be taken I do not see any need for it at this stage, nor for the foreseeable future 4 -5 decades. It would be extraordinarily detrimental if the step needed to be taken.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Such usages should not be limited at this time.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Some freedoms would be restricted by such a step.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Traffic should not be limited at this stage

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

As much disclosure as possible should be supplied.

What information would you like to receive about the speed of your Internet connection?

Full information if possible.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users?

Should these parameters be defined in the contract? If so, how?

Clear information should be provided. Percentages of outages could feasibly be supplied perhaps.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:
Gerard

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Simple01

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Education

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Not sure

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Maybe, who determines the degree of time sensitivity?

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Unreasonable practices may interfere with timely e.g. medical info & tests, banking, bill paying

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

Clear info on necessity

What information would you like to receive about the speed of your Internet connection?

Real honest speed info

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes if people wish to evaluate products & services

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a

balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have

to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Wolf Dauber

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Toshko Stoyanov

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in

Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of

the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Joe reid

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far

too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain

class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular

applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Keep the internet free of extra charges, no fast lanes, no hierarchy of results of search based on payments and lobbies.

Keep users online activity out of reach of big companies.

Kind Regards
Nuno Milagre

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? [NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Yann Hert

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Julie Théze

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

There is an artificial demand if all you can get is lousy mobile internet but still can stream e.g. youtube. But there shouldn't be one.

My name/organisation:

Matthias Wisotzky

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

None.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Not for me.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Prioritizing some services over others leads to degeneration of these other ones.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

I am forced to use services which can afford zero rating agreements because of limitation of my bandwidth.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

HELL NO! No way, NSA. We have seen where this leads, thanks to Mr. Snowden.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not at all. I like to make my own choices and can limit P2P if I want to stream.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes.

What information would you like to receive about the speed of your Internet connection?

Garantied minimum speed

Traffic management policies

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Yes, they should be described. One way to do it would be to give acceptable ranges.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation".

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to

contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft

of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Konstantin Krenz

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Mr. Ron Lamont

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere

with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic

management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees. Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services

could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation".

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

No, there is no demand.

My name/organisation:

Manuel Schiller

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

I cannot think of any, right now. If providers have the bandwidth, it seems much better to let the users decide what they want to use it for, than having providers prescribe offers, and make users pay for what they may not even want.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

No.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

I cannot see a positive impact. All vastly successful internet businesses have initially relied (and most still do) on the non-discriminatory way in which internet traffic is transported. The "internet revolution" could not have happened without it, and we would be foolish to hamper our ability to innovate only to make a few telecommunication providers more profitable.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Yes, they do limit what I can do as end user. For example, as a particle physicist, I work a lot from home during my off-hours, and our experiment depends on such contributions. The wide variety of specialist protocols we're using and the high bandwidth requirements that we have will never be recognised by providers or regulators as "special services", and will therefore be penalised. Thus, essential research is held back by commercial interests. I'd much rather decide myself what kind of internet connection I want, and then use it as I see fit, than having it prescribed to me (in the sense that network capacity is held back for certain commercial applications that I won't use, and could benefit from).

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is a very dangerous practise, and must only be employed in extreme cases (e.g. if so ordered by a judge to prevent a crime, or in case of serious network degradation by a single user).

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

The ISP should not prioritise. I know what I want to do with my internet connection, not my provider. If they offer a way how I can tell them what to prioritise, that's okay. But I do not want my traffic shaped based on what a provider thinks best.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes. My provider does not know which of the services I am using are time-sensitive, and experience shows that they get this sort of thing wrong if you don't have usage patterns that "follow the herd".

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Reasonable traffic management is to disconnect users who disrupt others, or cause problems. But if I pay for bandwidth, I want to be able to use it. For example, when working in high energy physics experiments, lots of time-sensitive and data-intensive traffic goes over my home internet connection. If my provider were to manage that traffic, they'd likely deprioritise it (since it's an absolute niche set of applications), thus crippling my ability to react - sometimes with devastating effects (for example, when controlling a high energy physics detector remotely in case of emergencies).

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

I need the guaranteed upstream and downstream link speeds, and latencies to the wider internet for different packet sizes, and the price. Everything else I pick depending on what I need from whoever provides it in the form I need. My ISP should not decide that for me.

What information would you like to receive about the speed of your Internet connection?

Uplink and downlink speeds, and latencies to the wider internet, that match what I measure. Anything else is superfluous.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Standard network engineering terms are sufficient. Defining them, and how they're measured, is required. For non-technical users, ISPs can give other metrics. But for those of us who know what they're doing with their network connectivity, it should be obvious to know what we're buying.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation.

It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic

management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services

by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Manfred Winter

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Philipp Hanek

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Buhl, Achim

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not at all

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes. Making one thing faster, throttles down another one

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

If infrastructure is down, prio on emergency/rescue services is ok. Else slows down innovation. New services need space to expand, new services are competition, competition is good.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

Today the only information is "up to" how many mbit/s my connection can receive/send data. All else are either hidden in the contract's details or not defined at all... Even if there's a data usage limit, it isn't stated clearly before signing the contract. Even worse, each potential provider gives different set of data on his offer, thus making it ridiculously hard to even compare two services. No freedom of choice if no comparability.

What information would you like to receive about the speed of your Internet connection?

All relevant technical information necessary to be able to really compare services.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

They shall even be stated before. Customers must be in a position to compare two services. Therefore regulation on which details are relevant, how to be displayed (e.g. All have to use the same unit) and that this information must be in advertisement or just one click away.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. Dear Sir or Madam,

I understand that you are probably being flooded with mass-mails regarding this topic, but please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration. Internet regulation is an important task for an European government and I take great interest in the legislation about it.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Commercial practices are a fundamental mechanism of the free market. However, the government needs to restrict commercial practices when it comes to preventing monopolies and cartels. Zero rating is a practice that is preferably used by cartels to exclude competition from the market, therefore it must undergo regulation.

My name and contact info:

Christian Loch
Vogesenstr. 62
66482 Zweibrücken

Please don't hesitate to come back to me if you have questions about my statements

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Voice calls and television are expected to have excellent quality and be free of interruptions with today's technology. However, it should be ultimately the customer's decision which services they want to prioritize in their share of bandwidth.

The only exception for a service, that should have a forced priority are emergency services like the 112 emergency number.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Yes, but every user/customer has different priorities. Generally, people want those services that they're currently focusing on to be without interruption and allow background services to be interrupted.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It is obvious, that specialized services with priorities controlled by the ISPs would lead to monopolization of internet services. Every non-ISP-related service provider would immediately face unbalanced competition by the ISPs which could always upsell their competitive offering through prioritization or zero-rating.

This will create a positive impact for large ISPs and entertainment corporations. However, innovation will not be rewarded as well in this system and is expected to slow down.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

While they cannot legally limit the rights of the end user, they can undermine these rights practically. An end user may for example have a free choice of video on demand services by law, but they will hardly chose a competitor's service if the partners of large ISPs offer zero-rating for their downloads.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Yes, particulary for services which the user has explicitely asked for to be prioritized. As stated before, the power of decision about which services to prioritize should be with the client, not the provider. However, deep packet inspection should become obsolete soon because end-to-end encryption should become the default.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

The ISP should either treat all traffic equally (except true emergency services) or prioritize the traffic in a way that the end user can choose. Legally the client has acquired the right to a certain bandwidth or a certain volume of data with their payment of the contract. Therefore, it is on the client to decide which services should be prioritized. The ISP may provide the technical means to shape the traffic. Also, intelligent defaults for non-technically educated clients should be possible. Ultimately, the client should always have the right to decide about traffic shaping, since the traffic is the deliverable from the contract.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, given that it is the ISP's decision which content should be discriminated.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Traffic management undermines the end user's right to choose freely between different online services. However traffic management is reasonable in the following cases:

- a) True emergency services. Examples: The emergency line 112, mobile data for devices of fire fighters, THW, red cross etc.
- b) Traffic management to enforce contract parameters. E.g. when an internet service contract only allows a certain volume of "high speed data", the provider has to have the right to enforce this by technical means.
- c) User chosen shaping. An ISP may add value to their services by giving the end user the possibility to choose their own priorities for certain traffic.
- d) Abuse prevention: For example if resources of a client have been hijacked and are used to attack other services (e.g. with DDOS), a provider must have the right to limit the internet connection to prevent abuse of services.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

Since traffic management directly influences the quality of different services, the information about such measures is crucial for making informed decisions. All commercial and technical conditions must be part of the contract by current legislation anyway. This is a fundamental feature of contract law.

What information would you like to receive about the speed of your Internet connection?

As an advanced user, I would certainly like to receive more detailed information than average users. However, I would also prefer to measure these myself than rely on statements from the provider.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

These parameters can vary from end user to end user as they naturally rely on the local parts of the "physical layer". These parameters can only become part of a contract if local conditions are taken into account. For advanced users, they certainly provide added value and an ISP can improve their services with this transparency. However, regarding the mass market, they don't need to be part of every contract.

Kind regards,
Christian Loch

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
Lutz Grunwald

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Rafal Blaszyk

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

M kool

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Manuel Roldán García

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with

the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
adrian beaky co-founder of tech globally

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere

with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic

management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organization:
Dave Coppard.....Retired

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
A Fair Price by servers

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental

to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the

restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Brian Bishop

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the

Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be

assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Johann Dressel/Autor

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Es soll überhaupt nicht gestört werden, denn schließlich bezahlen ja alle für ihre geschwindigkeit kein viel Geld

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Ja Absolut das Netz gehört dem Volk, und damit ALLEN

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
Absolut Bodenlose Frechheit und Beschneidung wäre das

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?
Kann dies zwar sehr schlecht Lesen, aber mir genügt es schon von einem Einzigem Provider abhängig zu sein

What information would you like to receive about the speed of your Internet connection?
Benütze einen eigenen Geschwindigkeitsmesser für das Netz

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?
Lass ich mal offen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and

businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Almost everything has become commercial. The demands come from transnational societies

My name/organisation:
Franck Boutault

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
Nothing

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
Maybe

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
Positive : all people can use it
Negative : Registration mandatory - No private policy anymore

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Everybody will be a slave without any right except to pay

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
Certainly no

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these

principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content,

applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the

complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,
Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Thomas Christian Werner

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No, that's none of their business!

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

None at all. Traffic is traffic.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access

to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. ♦ Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-

based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Offers that are seen as extra benefits with no perceived down side. Something like free streaming via itunes on saturdays, or youtube doesn't use bandwidth limit after 6PM. I think some users really do want this. If youtube videos are free then it's a net gain if i already watch a lot. The consumer thought is there is no downside, i just get what i got before and also more youtube.

My name/organisation:
Kehnin Dyer

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Well there is everything from a special email account, virus scanning, QoS (reducing p2p packet bandwidth allowance), ISP level media cacheing. In the future there could even be things like accelerated windows 10 store downloads, or special itunes streaming, or any number of vendor specific feature. There aren't any good reason to subsidise these services or tie them to a specific ISP. If the product is good then it should succeed on it's merit. Something like ISP level cacheing sounds great, faster content, less internet level traffic, But to implement it would need to break SSL, it would need to favor specific vendors (youtube vs twitch for example) and users would notice that things don't work as well on one vs the other. In short there aren't any positives for doing it.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Not as far as I know. Most of my friends just want faster more reliable connection to every service. We don't want to pick which ISP based on what we use, because I may never get the chance to try these new services without an open and reliable connection.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Theoretically specialized services could accelerate the adoption of new tech. ISP basically loses money now to advance a specific service for the future dividends on that service. It greatly negatively impacts it in practice because a competitive implementation needs that ISP enforcement to even get off the ground.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Rights, probably not. I still have the same rights. What /is/ limited is my behaviour and access. If facebook videos are free and youtube isn't I will always check facebook first. Likely i won't check youtube at all. And the same would be true if switched. My preference doesn't factor into it because the downside to using my preference is too high.

The real problem with these services is that they presuppose that internet access is a limited factor. We only have 5 Gb per user of access! This obviously isn't the case but lets pretend it is. If I am paying for 5Gb and use them then watch another 5 Gb of "free" content I have used 2 shares of internet. The way they will deal with that is lowering the limit to account for that free content. So now i am paying the same amount for 4Gb and free services, or 3 or 2. The amount will be determined by how much people use the "free" service so that the non-users subsidize the users, despite we all pay for it.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
Good luck stopping it there. Generally yes. They need to be able to track spammers so the ISP isn't blocked by other services as a bad player for instance, but there is no accountability if they choose to use that information for other purposes, like selling it to companies, monitoring user tastes and preference for targeted advertising, and more serious things like invasion of privacy.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
In my opinion they shouldn't be able to interfere with my connection at all. If I am using it for illegal activity they should report me to authorities, but don't prioritize packets. There is no difference between the packets on the wire so there is no reason to treat them differently.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
yes. I should be the one to discriminate between online content. Whether the experience is bad or not is for me to decide not some suit.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

I think the ideal traffic management would be a 6 month log of traffic that is encrypted and only accessed with a court order. If i am using some service that the ISP doesn't know about or have whitelisted and it gets limited because they just don't know it... That is annoying at best and can be much worse. I have to use custom software for freelance jobs all the time, so having my isp block that traffic because it is different could result in lost work.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

To be truly informed I would need to know everything from what kinds of routers are used, how many, what OS and version are they running. EVERYTHING. That is unrealistic ofcourse, but then It doesn't mean i am more informed by accepting that it just means i am accepting being uninformed. The minimum I require is that it is internet and i will be able to actually use it. I have lived in a place with 1 isp in a 100 sq km area, i still used their network even though all i knew was how much it cost.

I will always pick the isp with the most information available, with adequate speeds for my needs, even if it cost more than a comparable service.

What information would you like to receive about the speed of your Internet connection?
ISP can't accurately gauge this. I would prefer a testing period where i can personally verify speeds for my usage.

Information related to speed they can give that i would like is their router down time and load usage and a graph of load for the network. That way i can test at peak load to see if it is good enough for me.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Like i said it's too hard. many of these factors are not specific to the ISP but dependant on the remote network. Up and down time of the routers along with load would provide up to the second info on if the quality is good enough for a specific user. Not all users need the same level of stability.

As for contract... that is iffy. I think a minimum level of stability and internal network speed under load should be established.

Something like : The ISP will maintain a 99.9% uptime, speeds no slower than 5Mbps. Any network downtime longer than 30 minutes is eligible for a refund, etc.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity,

separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation

to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in

itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Saki Tzu

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Benedikt S.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services

could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation".

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.
Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This

would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides

the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”.

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the “consistent application of this Regulation” by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and

anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Dumay

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Charles TRESSENS

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Guilhem Cortès / France, Région Auvergne-Rhône-Alpes, Lyon.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Commercial practices is a term for 'legislation' put in place by companies (ISP's) to allow control over their users if they feel they are using the service overly. It is a negative practice, unless a business was utilizing network bandwidth on a humongous scale or user is breaking the law.

My name/organisation:
Stuart McInnes

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
voip services should be free (provided by the ISP) as physical phone lines (along with line rentals and call charges are applied domestically/ offline)

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?
Yes

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?
positive progress towards evolving technologies is only a benefit to all of mankind (which in-toll may invoke some progress in the non-technological world and potentially benefit the health of others)

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Streaming online content and also downloading and sending huge multimedia files on a regular basis could penalize a user (large families who use the internet for educational and personal use on a daily basis?)

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
No, this is what i believe to be an invasion of privacy. Unless there is due coarse for concern (breaking the law) then this is unacceptable behavior.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Connections should be optimized for multimedia purposes or file transfers, HTTP browsing should be of a lower priority (however this should still be of a highly acceptable level)

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Not so much freedom as user experience would be greatly affected.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

reasonable measures are ones which would impact a user if the amount of data being transmitted over networks was deemed to be on a humongous scale (terabytes). User's affected by throttling are throttled during peak hours of usage (which is when most users are accessing the internet, poor productivity)

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

No data usage limits, no throttling

What information would you like to receive about the speed of your Internet connection? Connection Download/ Upload link speed. Amount of dropouts and condition of line (noise etc) and the amount of connections currently on the same connected network.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

The more information given to the end users will ensure that clarity is given to the user to ensure that the condition and also current network capacity can perform at its stated performance (also ensuring the customer/ user feels the service they are paying for is fit for purpose).

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
shoot your mouth off films

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement

bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?
no

My name/organisation:
JAsper Floor

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Internet access providers provide internet access. Any other service they provide either uses internet or takes away from that service. No service they provide can be justified as not being over the internet. Even non-commercial services would not benefit from this as such services would never get the attention needed to create a better service than general internet.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There is no indication that the current internet infrastructure cannot handle specialized services. The infrastructure is getting better daily so there is no foreseeable need for specialized treatment of specific services.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

At best a secondary infrastructure is maintained leading to higher costs all around and stifling improvement of existing infrastructure. At worst there will be a have and have not internet.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Stifling competing services (ie, supressing gmail to promote your own email service, or supressing netflix to promote iTunes) leads to less choice for the consumer, effectively locking them in to a limited number of services. Information itself will be less accessible, as media companies pay to have their competitors removed from the consumers view.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. This is not only a violations of users rights to privacy it would be impossible to ensure the data is only used in the way described. Policing this would be next to impossible.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
not at all.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes. The ISP's technical requirements are my technical requirements (and those of everyone else). I pay for access to data not to specific kinds of data. The issues that arise from my use are for them to solve and meet not to suppress.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Routing traffic without knowledge of the content is reasonable if that means delivering the traffic. Disabling any provably illegal traffic, such as a ddos attack, is also reasonable though the proof of that will have to come with permission from a customer to investigate.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

A truly informed decision would require years of study. It cannot be left to users to decide if a particular contract is abusive or not as the technical and legal language can obscure issue beyond even the ability of an expert to understand.

What information would you like to receive about the speed of your Internet connection? Maximum speed, average speed, minimum guaranteed speed, network down time.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

TEchnical language will not be accesible. What people want to know is can I skype, can I watch youtube, can I play online games. Are my data streams reliable.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation

from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate

implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name: Robert McLean

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
Specialised services should be additional services 'on the top' of, and separate to, public services

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

There is no other utility product where the monitoring of purpose of use is done. No one monitors what we use electricity, gas or oil for. This is the thin end of the wedge toward a regressive and intrusive state or commercial organisation.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

When I purchase water, no one monitors whether I use it for drinking, showering or toilet flushing. the special categorisation will allow authoritarian and regressive governments to interfere with democratic freedoms.
It will also attack entrepreneurial growth of small businesses and the freedom of home workers. Driving more people back to working in offices will involve more travel, more fuel being consumed, more pollution and in regards to a growth in traffic movements, increased congestion and traffic accidents.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
the Berec 2012 guidelines stand

What information would you like to receive about the speed of your Internet connection?

I agree with the principle "ISPs should tell you the average available speed of their connection with a specification of the maximum and minimum speed in a user-friendly way, for example via a diagram or image."

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I agree that "ISPs should provide information on quality of services parameters in very clear language in all contracts. Concrete examples should be provided to help users understand the practical impact... and agree that "... information regarding possible issues arising when you use VoIP applications, such as videos delays or sounds effects. Basically, you should have the information you need in order to make reasonable assumptions about the quality of the service available for your particular priorities."

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to

entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet.

When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity.

This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the

guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2). Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2). In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach

makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services

could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation".

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.
Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:
Huzum Mihai-Adrian

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the

restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Zero rating could be of value to those who can't afford certain content or quality of support (this already exists for additional support services e.g. Symantec)The infrastructure and service provision costs does need to be re-charged to those using it.

My name/organisation:
Nigel Noyle
Nygon Associates Ltd

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

This concept of priority service maybe all well and good in areas with high band width that can support the burden with QoS (Quality of Service), however the world is not equal and the reality is that specialised services could soak up the bandwidth in rural areas and others that are poorly served by infrastructure where services would compete with each other for the available resource thereby failing everyone. Overall a bad idea. Services that required dedicated bandwidth have to consider resilience and risk and where necessary build their own infrastructure.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

There maybe a need in the near future but these could abuse their position and infrastructure paid for by others if treated differently. Think of the internet as roads and giving priority to those who paided the most. We accept emergency services getting prioiroity but would we accept it for someone in an expensive saloon car just because you have an older model? VPN (virtual private network) is already used as an approach to providing private internets within the internet.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Only time will tell. Whatever we guess now will be out of date by then.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Potentially this could happen, but only where there is restricted markets. This is most likely at the infrastructure level where access to the internet is required in the first place.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Though in principle I am against this, with the likes of Tech Savy terrorist organisations

such as ISIL, there is a real need for this capability, to identify and counter their information and win an information war that reflects in the real world as dead innocent people.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)? ISP's may need to do load balancing to ensure equitable balance between availability/usage across all service users.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Potentially as this would price certain services out of reach for less affluent users.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.
Video streaming can use up local infrastructure bandwidth regardless of the ISP provider.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?
Quality of Service e.g. ping, bandwidth; technical options available Async, etc; service support functions and customer care.

What information would you like to receive about the speed of your Internet connection? Ping, band with up and down stream, quality of service (consistency of the ping and bandwidth).

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?
Yes QoS should be part of the contract and could be represented in graphical terms against a benchmark standard. The QoS should be a reflection of the price of the service as much as the bandwidth.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than

internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic

management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental

to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the

restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating

altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable

measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

Commercial practice sounds like an euphemism for making money. Sure, there is a demand for getting traffic for free, but it's unfair to those who don't get it. There are already plans for cheaper access for extensive use based on economics of scale, they shouldn't be based on individual services though.

My name/organisation:

Dimitri Molerov

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

The internet of things might take considerably more internet traffic. This should be reflected as it is, without less traffic cost for upload and download for devices, businesses, etc.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

With specialized services, manufacturers would not be motivated to build low-traffic devices or software. Just as with electricity for businesses, costs would be externalized.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Definitely! As an end user I could be the third party not invited to the deal.

Those who pay less than the rest have a motivation to use more traffic. If this leads to peaks, internet performance for others could be jeopardized.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

Not the content itself. Rather traffic/content availability demands, i.e. differentiate between, static, dynamic websites, streaming audio/video content to ensure speed.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

If it helps enhance performance for all through better temporal distribution, then short-term prioritization of high vs. low traffic demands is ok.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

I don't think so. I imagine it like a highway with fast lanes for streaming content and slow for static websites. I don't care if my website takes a split-second longer to load (although I guess that wouldn't matter much overall). It should adapt to user behavior, though.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

If only video streaming gets high-priority and a website takes forever to load or crashes in the event, that would be unreasonable. If countries are affected differently by it, that would be unfair. Reasonable would be short-term prioritizing based on user behavior, e.g., if I change websites fast, the ISP might realize after the third or fourth one that I need more traffic now, whereas if I spend more time on a website it could slow down a bit. For server-side businesses, traffic could be adjusted according to high- and low-demand times, in a way to still have a cushion for fast use, but to expand it progressively from low to high to peak demand.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?
all of the above

What information would you like to receive about the speed of your Internet connection?

How fast it currently is, as well as the weekly overview, why it is faster/slower based on other users' behavior.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Starting with providing information on them would be nice.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on

net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation.

National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. ♦

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite

obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example. Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.

Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Tim Guy

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental

to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the

restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Imrich Koval

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Patrick Brochard

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as

application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-

user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as

an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic

management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
GUREMEIJI OkHacku

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)? ISPs should under no circumstances be able to prioritise or de-prioritise certain types of network traffic.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, most certainly it would. I might not be able to use certain services at peak times or might only be able to fully enjoy or make use of a certain service at 3 in the morning.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

The only reasonable traffic management measures I can think of right now, are essentially bandwidth limits in heavily congested networks (especially on mobile). In terms of broadband landline internet access, I think there should be no extra traffic management measures. Service Providers should provide strong enough infrastructure to handle all of their users traffic.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

What sort of traffic management policy applies to my internet connection ? Are specific services like P2P or Skype blocked or throttled ? Is there a fair use policy on how much traffic I'm allowed to use, even if the service is advertised as a flatrate ?

What information would you like to receive about the speed of your Internet connection? Download Bandwidth, Upload Bandwidth, Approximate Ping Times, Up-Time in Percent

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

ISPs should map rudimentary latency, jitter and packet loss data for all their connections. Then they should state the collected data for the specific connection together with the available and expected bandwidth to the user, when he or she is ordering service for his or her specific connection. There should be reasonable and realistic lower/upper limits in contracts, to make sure the service providers actually do provide a good service for their users.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be

ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or

severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are

misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states

and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? I don't believe it is right for any ISP to be able to discriminate against their users based on which services they are using. In fact I do not believe that an ISP even has the right to be viewing which sites or content their users want to access, I believe it to be an invasion of my privacy. Like wise I believe that ISP's shouldn't be able to charge their users based of the amount of data they are using, I believe everyone should be able to pay a flat rate for their internet services and recieve an equal experience regardless of their service provider, which also means that there shouldn't be extra charges for high bandwidth connections; after all what is stopping an ISP from throttling a connection in order to try and make their users pay more for a higher bandwidth package.

My name/organisation:
Stephen Robinson

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

For an ISP here in the UK such as sky TV, which is also the owner of Now TV I believe. If commercial practices were allowed they may be able to say that their service (Now TV) doesn't count towards a users bandwidth cap, where as a service like netflix or amazon prime does. Which in turn would drive more users towards either using the now TV service or just cancelling all subscriptions all together. The again as has been the case with an american ISP and netflix, sky may ask netflix to pay a premium to the ISP in order to allow their users to use the service without it counting towards the cap in which case we are back in the same position that they are now able to take a larger number of consumers as opposed to amazon prime or any other subscription service.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

As mentioned in one of my previos answers I do not believe that an ISP should be given the right to monitor an individuals habits on the internet including the services and content that the decide to use while connected to the internet. Even if it was argued that by doing so they could better "optimise" the flow of traffic on their network if a high number of users were using large amounts of bandwidth in connections to streaming services we'd be back inm the same position as it would effectively be giving them an excuse to provide "fast lanes" to certain types of services.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

I don't believe that an internet service provider has any right to impose a limit in bandwith or data cap restrictions on an individual regardless of what service they are using. With the money I pay towards my ISP and line rental (here in the UK) I believe they should use to upgrade their services in order to create the best experience for their user rather than trying to make a profit in every conceivable way possible.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Something I would define as reasonable traffic management is reducing a customer's bandwidth during "peak times" IF their actions on the internet are having a negative effect on other users who are trying to access the internet at the same time. However unreasonable traffic managements may include the idea of reducing a customer's bandwidth in an attempt to pressure them into paying for a higher tier service such as fibre which would give them unrestricted bandwidth/internet use.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

When choosing an ISP personally I look at the bandwidth/speed of the internet connection I will receive (not what the advert suggests of up to 50Mbps, I want to know exactly what speed I will be able to get if I choose their network). I want to receive my internet connection with no stupidly low bandwidth caps such as 20GB per month (because with my heavy usage I would go through it in less than an hour)

I believe that the ISP should not be able to see my network traffic, I want the option to use my own networking equipment such as routers, WIFI access points, modems or network switches with support from my ISP if I choose to do so.

I don't want my ISP to be able to discriminate between the services which I use and the speed of the connection that I receive to each of these services. I don't want my ISP to be able to purposely limit my connection to the internet regardless of the time of day, I would want an equal amount of bandwidth in comparison to any other customer on the same network and infrastructure.

What information would you like to receive about the speed of your Internet connection?

As mentioned I want to know what the bandwidth will be when I use the connection, I want to know exactly what the download speed will be in MBps and Mbps (Megabytes and Megabits).

I would like to know the ping/response time to certain services when using the ISP.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I believe these parameters should be defined in the contract, if they wish to find out what the latency is they can send an engineer to the phone exchange of my street and test it prior to me signing the contract.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and

businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an

arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic

traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with

their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines. There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2). Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people

have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups.

Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic

management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialized services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimization of specialized services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialized services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialized services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialized services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialized services allowed under the EU Regulation must come with their own

capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialized services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialized services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialized services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore

materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorized business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymized traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft

guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behavior in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When Internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by Internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines. There are forms of commercial practices that interfere

with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. Zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-

case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Denis Cerclet, universit  de Lyon

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services

by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Nicolas Simon, Math teacher and scientific museum director.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Cordialement,
Simon NICOLAS

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:

Ángel

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
I D Kendall

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6 July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Serrano Guillaume

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services

could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation".

BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and

subsequently rejected, be considered an antidote to anti-competitive behaviour in itself.
Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? Absolutely no. Zero rating is intransparent - how should the end user decide or overview which services are zero rated by the telco he use?

My name/organisation:
Achim Brüninghold

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

The telecom companies cann not argue that they need special services for life saving services and then switch normal ("POTS") telephone connections to the new "All IP" telephone connections - because that is exactly the opposite: the separate (old) analogue or ISDN telephone service functions even when there is a power failure because they have USV at the operation cenztral. But with the new "all ip" connections no "Red Cross emergency Call" will function when the Outdoor DSLAM or the apartment of the customer/user has a power failure. In other words: switching from plain old analog telephone "POTS" to the new "ALL IP" connections is diametral opposite of special services.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

Therefore no Outdoor DSLAM of the telcos has a USV nor any of the end users has a USV for their MODEM / FRITZBOX / Cablemodem / whatsoever it makes no sense to have a "specialised service" on the same wire with the same power source - because when electricity is gone all services are out of order. The only thing what functions without power is the old telephone system because the old telephones does not need extra power for themselves (as long as they are corded) and there is no extra electricity using MODEM with analog/digital and digital analog conversion. And of course the old telephone operation centrals have USV. But special digital services is nonsense - because there is no DAC/ADC without electrical power. And if you need privacy the best method would be something like a VPN. Therefore I see no demand for special services on / in the internet. If somebody really needs something special it would be better to dig an extra cable (make a separate connection) which does not use / is not connected with any internet cables and has its own power and USV.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

If telcos are allowed to use special services the could prefer there own daughter companies or "allied" companies. For example if telco1 has its own film/music library service it could

be possible that the use of this service is not burdening the "inclusive volume" of of the (mobile) internet "flat"rate. Flat in "", because as a matter of fact there are no mobile flatrates only "flat"rates, because the flatrates here are limited by volume of (for example) 500MB, 1GB, 2GB, etc. and - when this limit is exceeded - switched down to 64Kbit (which is around 1% of the normal speed of UMTS and below 0,5% of the normal speed of LTE). In shortly: positive affects none - negative a ton.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

I know that commercial rights are limiting my rights, especially the use of DRM: If you BOUGHT and paid for it Freelancer from Microsoft it does not work an Windows 10 from Microsoft! Because Microsoft Windows 10 busted the "starforce coy protection". If you want to use your paid product you have to use a "no CD crack"! And this is the same whith dotzens of games (For example the million selled GTA IV) and other software programs: their DRM (their copy protection) does not function any more or the only-registration servers (the activation servers) are turned off/shut down by the software companies and then your paid product is useless!

And if you are thinking that it only affects software - think again of Microsoft Zune: if you bought your music there the music now (and you money!) is useless, because Microsoft has shut down the complete service and it is now impossible to "re-activate" your bought and paid(!) products on another music player, when your old zune player get out of order / or the battery gets old and loses capacity.

Just think of it: you buy CDs or vinyls and then when your CD-Player / turntable gets out of order you have to buy all your CDs and vinyls again?! That is a kind of felony and scam! The industry scams the end user!

Secondly Sony-BMG has put a copy protection on their Music-CDs which even installed onto Windows PCs if you decided (and klicked) "NO". It was installing a root kit which is a kind of malware. In the USA (which has consumer rights) SONY-BMG had to pay a compensation to thousands of user for infecting the computers - but in EU they had to pay nothing. That is because practically end users here has no rights against big companys but vice versa big companies versus end users has every right within EU. I know theoretically end users also have rights over here - theoretically. But practically none... or why SONY-BMG has paid absolutly not even one Euro Cent compensation here for thousands of computers which was infected with their Sony BMG root-kit?

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No - therefore the letter post is not allowed to look into my letters. Otherwise the secrecy of post and telecommunications is not worth a penny any more.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)? Onyl so far as it was stated in my contract with the ISP. Therefore there is nothing written about it - none. And when they want to interfere they have to madantory communicate it very clearly that they are not providing full internet service, but rather only restricted services.

And by mandatory communicating it I mean that they have to write it as large as the good features - not hidden in those fine prints (Those asterisk texts) in 1 point fonts at the end of the prospect.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Traffic management should only be allowed so far that it is absolutely necessary for keeping the net infrastructure operating safely.

Of course it is possible that slowing down one service makes it un-usable. For example online communication like skype, teamspeak, jabber, etc. needs are useless when there is too much time dilatation.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

As mentioned above an unreasonable management can make services useless.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

I would need the normal and the minimum (guaranteed) speed of my connection, and the normal and the worst case (guaranteed) ping time. The companies have to communicate and advertise what they deliver in the "worst case" for the not prioritized services. For example: if telco1 delivers 100MBit at a maximum for their own video on demand service and only 10MBit for the other services this should be mandatory advertised as a 10MBit connection not as 100MBit.

What information would you like to receive about the speed of your Internet connection? Maximum, normal and minimum (guaranteed) download speed. Maximum, normal and minimum (guaranteed) upload speed. Minimum, normal and maximum (guaranteed) ping times. Minimum, normal and maximum (guaranteed) packet loss. So therefore a 12 point matrix should be enough.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I think that 12 values are enough - so that jitter is included in packet loss. But be it this or that - necessary is that the "worst case values" are the values which are used for advertising and communication. A internet connection which has a speed "from 1 to 50 MBit" and a "ping from 20 to 800 ms" is a 1 MBit connection with a ping of 800ms - and therefore has to be advertised as a 1 MBit connection with 800ms ping.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says

that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users

whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Jerome CLAUDE

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Jean-Christophe DIGUET

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet

ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental

to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the

restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce

it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Bernard Audebert

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
ISP should only be allowed to interfere with private internet connection in order to enforce minimal band with for other users of the network you're on

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum

bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of

innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? NO need for special handling based on buying power. ONLY by logical and well thought decisions of elected parliaments.

My name/organisation:
Karlheinz Mohr

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?
Data connections including cloud storage that is not allowed to leave legal territory. E.g. to stay within the data privacy regulation in the EU (e.g. not even theoretical access by any operator/admin sitting outside the EU) or governmental restrictions (e.g. no data storage outside the UK)

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

The world needs with the IOT coming an even more safe and reliable Data connection for critical infrastructures as defined by governments.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: More trust in reliability and data protection for the IoT

Negative: Bigger hurdles for niche players to enter the market of IoT in such areas.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

I hate that where ever I live for a while, google news only shows me such news that they think is relevant for my area where I momentary live. I now much better understand that the US citizen have no clue what is going on in the world. As a German having lived in the US this commercial practice of making news available as appropriate has been a nightmare to me.

The worst thing then are digital rights that apply regional restrictions which then result in the fact that I am not even allowed to watch TV news of the country I want in the country I am...

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

NO. NEVER. If traffic management is ruled by commercial practice. But if properly regulated, then yes, to protect against the dark side of the internet in all shades...

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)? Only very limited to protect critical services or to keep a minimum bandwidth open for having Telephony still possible and understandable. Also with languages that need different frequencies to be understandable than the assumed standard US English.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

Location, Data Protection Level, List of governmental access applied to my service, and LIST of all financial Sponsors behind that cheap or free offer.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and

consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?
None whatsoever.

My name/organisation:
Harry Johnson

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?
Increased resources for ads and commercial ventures versus non-commercial will hinder the growth of open-source and free resources.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
Never in any way. This is the same as asking if government bodies should monitor our conversations.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?
Not at all.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?
Yes.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?
detailed dumps of ISP server logs, interpretive guidelines for assessing policy, synthesis reports.

What information would you like to receive about the speed of your Internet connection?
Full and complete information, including statistics on events or processes prevented by current policies - ie: things which cannot be measured because the current policy means they never occurred.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?
Parameters and definitions should always be included in the contract, alongside interpretive guidelines and a means for complaint or to report non-compliance on the part of the ISP

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of

innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited

access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application

agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:
Jonathan Slotboom

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

Specialised services allowed under the EU Regulation must come with their own

capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users." Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access

YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2), and 16 of the Charter of Fundamental Rights).

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it

seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Allan McFadyen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications,

but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. [NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole. If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? [ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear

from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view?

Commercial practice is normal, the internet is not a free human powered network where we can all share and unite. It's not (not that i know of) a worldwide public thing that belongs to everyone.

The internet in a communist world would be great, if communism was possible. But everybody needs to eat, and the companies that are on the top need to stay on the top, that is normal. My very own understanding of commercial practices is something no end user likes, but which is needed. The problem is, if i don't, then someone else will.

My name/organisation:
I'm a student in France

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Private and secure mailing or data transfer (for companies) could be an optimised service, to prevent industrial spying.

The important characteristics are trustworthiness and speed.

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

In my opinion e-heath is either an iphone/android app or a service for specialised needs. Second part is ok but we are not likely to hear much about it, while the apps will definitely make some noise, in a kind of "gadget" way (eg the connected band that tells your heartbeat and all, no regular athletic person ever needed that, only high levels and they had some better equipement even before). The web is going towards mobile data, apps. And apps are just the opposite of neutrality, since they can promote or weaken an operating system (eg snapchat not being available on windows phone).

On the opposite, connected cars have to be on a separate network, for security. But that doesn't mean connected cars will be neutral in any way. In fact, maybe the first self driving cars will be google powered, and the data be sent through google-friendly isp. Any technological improvement is made, produced, payed so it can make a benefit in the future. Just like the internet, it has been made by the US and it will help (I mean help the economy) the US before the rest of the world, and it is perfectly normal.

What could be the positive and negative impacts of specialised services on future innovation and

openness of the Internet?

Not sure i get what "openness of the internet" means.

In my opinion, net neutrality was dead and buried the day search engines started to sell ranks in the search result. That is unlikely to change.

If openness of the web means I can, wether i live in California or Shangai, post my stuff online (on my personal space and not on a server located elsewhere which i'd have to pay) and earn money with ads and having the same visibility than if i posted it on youtube, that would have a real positive impact on international competition. The question is, do we really want a wide-open internet where a hollywood batmanvssuperman3 could theoretically be overthrown in a few hours by a budget movie in a poor country. Not sure. Even more important (for most people), do we want a web where anyone can spread or hear hateful ideas ?

If openness of web just means no fast lanes, well i don't really see the point. If half the planet goes on facebook at the same time, you need fast lanes, period. But the attribution of bandwidth could be refreshed every day by an independant, non-profit organisation, that would be cool.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

I admit I don't know much about isp business, but it's like in cinemas when you can have a combo offer with mcDonalds, even though it's good neither for the economy, for mcDonalds is kind of a us giant that don't pay lots of taxes abroad, nor for the customer who'll eventually get fat after a couple. But the cinema don't have the choice as the other locals fast foods aren't as attractive.

So I think it's almost the same, cinema being isp and mcdo being facebook or youtube.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

They should, but it raises 2 issues.

-lack of confidence from non professionals users to isp

-lack of information regarding what they do if they find something illegal (eg streaming pirate movie)

of course they ain't gonna write a report for every movie piracy, but we don't know that

With all the fuss about the iphone that the fbi said they could not look into it, I wish them good luck with that. Yesterday, fact of youngest getting paranoid about electronic surveillance even when they done nothing wrong was either funny, either worrying. Today it's for the best, privacy of a system is now the key feature and all web navigators have a private window option.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

They might consider de-prioritise p2p (why on earth would they possibly do that?), and prioritise videos as they are more and more videos on a single web page.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

If isps time sensitive webpages, most webpages would get time sensitive

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

mostly commercial practices, to know what companies i'm supporting by choosing this connection

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

maybe there could be something like every time connection slows or breaks i get a refund from what i pay them. but that won't happen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement

the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Dino Tarrigno

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere

with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic

management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

i understand commercial practices as any buisness need. there will be no end to who qualifies as commecial practice.

My name/organisation:
luke johnson walker

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet? all internet access should not be prioitised under any circumstance

Is there a demand for specialised services (i.e. services offered in addition to internet access that provide optimised connections to particular services like e-health or connected cars)?

no, the resposibility for the abilty to connect with full accessabiliy should remain equal.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

by using any other reason to throttle users in favour of premium users will only lead to abuse.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

yes, as an end user my internet will be throttled unless i qualify or subscribe to a premium service. this is a dangerous slope

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

no, the post office dosnt read our mail to determin weather the contents should be prioritied or not!!!

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

not at all

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

yes

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

whilst i dont believe in traffic management, the current policies in place for throttling upload speeds for a limited time when A use breaches the isp's traffic mangament policy is as far as this though go. an unlimited usage policy is just that. we all wok and use the internet in differant ways, just like driving.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

i always pick an isp that does not use traffic management, even though they may all advertise unlimited usgae, its the small print you have to read.

What information would you like to receive about the speed of your Internet connection?

the truth!

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

yes, and they should be written so the average end user can understand instead of being allowed to hide behind technical jargon

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16

require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this

approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

**My name/organisation:
Fabio Svanetti - T.R.T.**

**Do you think that commercial practices could limit your rights as an end user?
Could you provide examples?
No, if done correctly without discrimination**

**Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?
NO!**

How much should your ISP be able to

interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

NoneNo

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Not really

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

ALL interferences

What information would you like to receive about the speed of your Internet connection?

Complete and reliable

How should ISPs describe other

parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

I'm not qualified to tell.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market

entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC

guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft

guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and

anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be

read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth). According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should

bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
D. Peters

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Frans Dammers

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? No. Such practices are rarely explained in sufficient form to consumers and they often pay the price. By complicating the market, you are complicating the consumers' ability to make the best decision for themselves. Many consumers are already the victims of telecoms' scams.

For example, in Germany, by signing up for a new phone contract, consumers are often already given a form which allows the telecom to take money straight from their accounts when using services on their account. This 'box' is left ticked by default and the salesperson must merely skim over what this box on this legally binding contract means. When later, some unscrupulous advert that a tablet user accidentally touches automatically takes money from the user's account, the user is not aware of the fact. A program silently runs, the consumer is unaware that they have 'bought' some bogus thing until their bill comes from the telecom at the end of the month. The telecom refuses to do anything about this illicit use of their services because they make a percentage of the profit everytime this bogus company sells their non-existent product. Where can the consumer go for redress? There is no consumer protection law prohibiting such an act and it's standard practice by all telecoms so there is no alternative. And your average grandmother has neither the means, nor the time to start a court case against a telecom and little hope of winning.

In short, commercial practices are usually a nice way of saying legal scam.

My name/organisation:

Richard Sutton

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Local authority websites (such a voting services, access to local healthcare, police, tax returns). So long as they provide services essential to the people of the area and are not used to influence citizens' opinion (i.e. canvassing before an election). Reliability is important as it can act as a lifeline to people in need. Security is also essential for such services as they handle sensitive/ confidential information.

Is there a demand for specialised services (i.e. services offered in addition to internet

access that provide optimised connections to particular services like e-health or connected cars)?

Whilst there is demand, such services cannot be awarded to limited companies and must either be an essential service, usable through publically available APIs, or usable by local authorities and non-awardable to specific companies (i.e. the Department of Health cannot award a company exclusive use and profit from an e-Health service. The DoH would have to pay a one time development fee, and the service would have to be available to all, without any boundaries (except maybe a Nationality/ residence status check).

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

+ Easy to use and fast services.

- Customers gravitate towards such services because of their convenience and alternatives suffer.

- Customer loyalty is artificially established.

- As soon as all alternatives have left the market, the provider can hike up fees without any consequences.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

See above box.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No. There is already too much monitoring. This leads to a serious invasion of privacy and opens individuals and companies up to exploitation.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Not at all.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Reasonable traffic management might be if a business often uses very large amounts of data for professional reasons to the point where other users are affected by the traffic.

They can be limited unless they pay extra for their commercial use of bandwidth.

Unreasonable is when an individual uses a large amount of data due to commercially available products such as video streaming or game playing and are strangled for their effect on the network. If they are standard users, the ISP should adapt to general usage.

What information would you need to make an informed decision about your Internet connection? For example: traffic management, commercial practices or technical conditions?

All of the above. Expected average download and upload speed should all be clearly given in Mbs.

What information would you like to receive about the speed of your Internet connection? As above. A clear diagram for the area would also be informative to show actual physical effects of hardware and distance.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

ISPs should always offer basic level use for average consumers (allowing good quality VoIP and gaming) and this should be clearly defined in the contract. Lower level quality should not be offered as it disadvantages those on low incomes or older/ younger people.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of

specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and

should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are

misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
claudio manfroncelli

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the

provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is

permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term “commercial practices”? Do you think there is a demand for “commercial practices” such as zero-rating, from the end users’ point of view? There is a demand for video.
if this is allowed, it immediately gives a rent advantage to some video providers over others.

My name/organisation:
Jean Laporte

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

None available for general consumers.

Security update are not time critical as to allow for an exception.

Banking services are not time critical as to allow for an exception.

Specific services to be allowed by exception for:

- Emergency communication services (police/firemen/ambulance video feeds)
- Classified diplomatic /military communication services
- Professional healthcare services (remote surgery... NOT individual consumer health monitors)

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Similar to the current move from browser to app based access.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

limiting access to Google GPS services, youtube (as free/illiad has done at times)

Allowing fast speed on some services, reducing available bandwidth to others (e.g. your neighbour watches soccer on priority with the same ISP, and your access is abnormally reduced for online gaming)

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No.

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

None.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Yes, based on your preference for mainstream activities.

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Global throttling of a network zone (not user specific but zone specific) to prevent a breakdown.

Anything else is unreasonable.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

a table summarizing all impact.

What information would you like to receive about the speed of your Internet connection? average timegraph of available DL/UL speeds over a week (weekdays vs weekends)

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters (typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

most users are not knowledgeable enough to understand this. general grades should be applied if requirements are met over 99.5% of the time:

- pro gaming
- gaming
- 4k video streaming
- HD video streaming

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their

data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for

sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear SiNN-Consultation or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Fabrizio

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[TM#1v2v2]

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name:
Erika Otto

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management? Absolutely not. An ISP has no more right to monitor my use than Royal Mail does to open my mail (a well entrenched principle that should be applied to all personal communication).

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised

services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-

by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs’ assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet. It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of

applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy.

Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-

based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Cristian

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Francesco Di Ruscio

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft

guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. [NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[TM#1v2v2]

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

My name/organisation:
Andreas Köhler
Continental Engineering Services

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the

context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures. Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of

these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities

should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation. Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations

on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on

the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to "guarantee the continued functioning of the Internet ecosystem as an engine of innovation". BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management

measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

hp@sundstein.dk

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliabiity) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

When internet providers are sponsored by service providers on the internet, to reduce the cost of their users internet access, there is a problem howto get EU to regulate this.

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive: better access to more services, without restrictions. Negative: A higher cost for the internet access.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

If my mobile phone provider includes services in my mobile card that are without data roaming, otherr similar services can be more expensive and slower to use.

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

I am afraid of, that the parlaments in all our contries, will set the rules for this, so we have it in Denmark.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Dear Sir / Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

Is there a demand for “commercial practices” such as zero-rating? Could these limit your rights as an end-user? Please provide examples.

Not sure

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

It could allow them to slow down services which interfere with their profits

Is there a demand for specialised services? Which services should be allowed this special treatment?

None

Should the ISP be allowed to monitor your traffic, including its content (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your Internet connection - for example to throttling or prioritise certain types of online traffic (video, P2P, etc)?

Not at all

What information would you like to receive about your Internet connection, such as its speed, quality of service or how your traffic is managed?

All of it

The Regulation allows specialised services only under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This cannot be the case with services that can also function on the open, best effort Internet. Furthermore, Recital 16 prevents specialised services from being used as circumvention of the general net neutrality traffic management rules. Any deviation from these safeguards to widen the applicability of the concept of specialised services would inevitably result in increased market entry barriers and thus weaken the innovative potential of the Internet as a whole.

The diversity and innovative capacity of the Internet ecosystem is built upon the low cost of innovation and low barriers to market entry. These principles ensure that from day one, every enterprise, startup or non-commercial service – no matter how small or well funded – has the potential to reach a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy is only ensured by an open, neutral and non-discriminatory Internet. When ISPs are allowed to interfere with the decisions of their customers by economic or technical discrimination, this essential freedom is lost. According to Recital 1 of the Regulation on net neutrality, the legislation has to be interpreted in light of these goals.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

When ISPs are allowed to charge for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, to encourage their customers to increasingly use specialised services. This effect will be detrimental for minorities, disadvantaged people and startups that cannot afford special access to all networks in which they may want to reach customers, and the development of the free, open and innovative Internet ecosystem.

Economic discrimination (zero rating) interferes with my right under Article 3(1) to access and, in particular, to distribute information freely. When an ISP discriminates between providers of content, applications and

services via an Internet access service by making them unequally accessible, this constitutes an arbitrary interference in the essence of my right. Furthermore, this practice restricts my rights under the Charter of Fundamental Rights (Articles 11, 15(2), and 16). Therefore, economic discrimination must not be allowed under the BEREC guidelines.

The Regulation has very clear rules on what constitutes reasonable traffic management. According to Article 3(3), all traffic management should be done in an application agnostic way, if possible. Class-based traffic management harms competition; it risks unintended damage to specific applications; it can discriminate against encrypted traffic; it creates uncertainty for content application and service providers; it stifles innovation; it can harm individual users, and can create regulatory overload. Therefore, applying class-based traffic management in situations where application agnostic traffic management would suffice is neither necessary, proportionate, transparent for the user, nor non-discriminatory.

Kind regards,
Walter Levy

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation. The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines. Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word “other” before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the “detriment of the availability or general quality of Internet access services for end-users.”

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it

is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against

encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.

Kind regards,
A concerned citizen

Subject: mehr Netzneutralität
Date: 15 July 2016 10:28:04

Sehr geehrte Damen und Herren,

bitte berücksichtigen Sie diesen Stakeholder-Kommentar bezüglich der BEREC-Leitlinien zur Netzneutralität.

- Die Regeln zur Netzneutralität schützen uns alle vor übermäßigem Einfluss von Konzernen auf unser Internet und fördern Vielfalt, Gleichberechtigung, Wettbewerbsfähigkeit und Innovation.
- Wenn wir "Überholspuren" für die höchsten Bieter erlauben, müssen sich alle anderen mit einer "Kriechspur" abgeben. Diese Diskriminierung würde es unabhängigen Medienbetrieben, Start-ups und Bürgerbewegungen wie unserer erschweren, neben dominanten Akteuren wie Google und Facebook zu existieren.
- Ich bitte Sie dringend darum, alle Schlupflöcher in den derzeitigen Vorschlägen zu schließen, die es Dienst Anbietern ermöglichen würden, bestimmten Inhalten Priorität einzuräumen und durch Vorzugsbehandlungen, "Zero-Rating" oder klassenbasiertes Verkehrsmanagement zum Torwächter zu werden.
- In Brasilien, den USA und Indien haben die Regulierungsbehörden strenge Regeln zur Netzneutralität eingeführt, nachdem ihre Konsultationen bei den Bürgern auf überwältigende Resonanz gestoßen sind. Jetzt ist Europa an der Reihe, ein offenes und demokratisches Internet zu schützen.

Aus diesem Grund bitte ich Sie darum, die aktuellen Leitlinien-Entwürfe entsprechend der folgenden politischen Analyse zu ändern:

<https://avaazimages.avaaz.org/GuidelinePolicyAnalysisPdf.pdf>

Mit freundlichen Grüßen,
Leon Fellows

Subject: Re: EREC net neutrality guidelines
Date: 06 July 2016 20:06:04

Dear Sir or Madam,

Please take this Stakeholder comment regarding the BEREC net neutrality guidelines creation into consideration.

What is your understanding of the term "commercial practices"? Do you think there is a demand for "commercial practices" such as zero-rating, from the end users' point of view?

My understanding is that this implies discrimination amongst users and that the only demand would be from large multinational corporations wishing to control the internet and dis-advantage small competitors.

My name/organisation:

A J THOMPSON

What other "specialised" or "optimised" services (that can be give specific additional characteristics like speed or reliability) in addition to Internet access, can be offered by Internet access providers? What are the characteristics of such services that would justify the fact that they are not offered over the internet?

Health Care, Emergency Services

What could be the positive and negative impacts of specialised services on future innovation and openness of the Internet?

Positive-If extra revenue from specialised services is entirely re-invested in infrastructure/security/encryption for the benefit of all users.

Negative-Over commercialisation of the Internet in variance with the philosophy of openness and equality endowed at its inception.

Do you think that commercial practices could limit your rights as an end user? Could you provide examples?

Yes, restrictions on encrypted traffic, discrimination between users ex. users that are considered "un desirable"

Should the ISP be allowed to monitor the traffic of their users, including the content of the traffic (e.g. through deep packet inspection) for the purpose of traffic management?

No

How much should your ISP be able to interfere with your internet connection - for example to prioritise or de-prioritise certain types of online traffic (video, P2P, etc)?

Possibly depending on the Mega Bit per second requirements of a user so that low volume users are not swamped out by heavy traffic from say, video, very large file transfers, etc. To a large extent this is already dealt with by contention on internet accesses.

Would your freedom be limited if ISPs discriminated between online content based on their technical requirements like time sensitivity?

Not understood

What would you consider to be "reasonable" traffic management measures? How can "unreasonable" traffic management measures affect you as a user? Please, provide examples.

Solely based on volume.

What information would you need to make an informed decision about your Internet connection? For example: traffic management. commercial practices or technical conditions?

Contention, effective debit, reliability, latency, jitter, packet loss, discrimination between users

What information would you like to receive about the speed of your Internet connection?

Effective up/down load speeds graphically per day/week/month.

How should ISPs describe other parameters of their Internet access offers, such as quality of service parameters

(typically latency, jitter, packet loss) and quality as perceived by end users? Should these parameters be defined in the contract? If so, how?

To be as transparent as possible on all the parameters that they monitor.

[NN#1v2]

The diversity and innovative capacity of the Internet comes from the low cost of innovation and low barriers to entry. These principles ensure that every established business, start-up or non-commercial service—regardless of their size—has an equal opportunity to communicate with a global audience in a manner equal to their competitors. This driving force for the prosperity and diversity of the online economy can only be ensured by an open, neutral and non-discriminatory Internet. When internet providers are allowed to interfere with the decisions of their customers by economic or technical discrimination, this freedom is lost. Recital 1 of the EU Regulation on net neutrality says that legislation has to be interpreted in a way that ensures our freedom to access and distribute information and that protects the Internet as an engine for innovation.

The current BEREC guidelines create a solid foundation for the protection of these principles. The enormous task BEREC was left with by the legislator has been fulfilled in a balanced and careful manner that ensures the protection of the rights of consumers and businesses guaranteed by the regulation. The guidelines provide much needed clarification to the text, but need to be further specified in a few points.

[SpS#1v2]

The EU Regulation on net neutrality allows specialised services ("services other than internet access services") under strict safeguards. Article 3(5) and Recital 16 require the optimisation of specialised services to be objectively necessary for the functionality of key features of the service. This would not be the case with services that could also function on the open, best-effort Internet. Furthermore, Recital 16 prevents specialised services from being used to circumvent general net neutrality traffic management rules. Any deviation from these safeguards that would widen the applicability of the concept of specialised services would increase market entry barriers and thus weaken the innovative potential of the Internet as a whole.

If ISPs are allowed to charge online services for preferential treatment, they have an incentive to stop investing in network capacity for the "normal" Internet and reduce their data caps, in order to encourage their customers to use specialised services. This effect would be detrimental for minorities, disadvantaged people, not-for-profit services and start-ups that cannot afford special access to all networks. This would also be detrimental to the development of the free, open and innovative Internet ecosystem.

[SpS#2v2]

Specialised services allowed under the EU Regulation must come with their own capacity, separate from the Internet access service. They cannot undercut the average maximum bandwidth that the EU Regulation guarantees.

Paragraph 118 of the draft BEREC guidelines suggests that the delivery of specialised services could limit an individual end-user's Internet access service capacity. This is not in line with Article 3(5) of the EU Regulation. It also contradicts the requirements for the provision of specialised services in paragraphs 113 and 117 of the draft guidelines.

Furthermore, the legislator clearly established its intention to ensure that end-user's Internet access service capacity remains unaffected by the delivery of specialised services by modifying the wording accordingly during the negotiations. In these final negotiations on 6. July 2015, the legislator decided to delete the word "other" before "end-users" in Article 3(5). That final version of that article now establishes that specialised services cannot be usable or offered to the "detriment of the availability or general quality of Internet access services for end-users."

Finally, paragraph 118 of the draft guidelines is not in line with Article 4(1)(d) of the Regulation (on transparency) nor with paragraphs 142 and 144 of the draft guidelines, as the average and maximum bandwidth agreed between the ISP and the end-user are no longer met.

[ZR#1v2]

"Zero-rating" is a commercial practice imposed by internet providers. It allows unlimited access to certain sites and services, but imposes a payment for accessing the rest of the internet.

It is good that there are a number of clear restrictions on zero-rating in BEREC's draft guidelines. However, if most of the current forms of zero-rating are going to be banned or severely restricted, why not ban zero-rating altogether? That would cut five pages from the guidelines and make the job simpler for the National Regulatory Authorities whose job it is to implement the guidelines.

There are forms of commercial practices that interfere with users' rights protected under Article 3(1) of the EU Regulation to access and, in particular, to distribute information freely. When a commercial practice of an ISP discriminates between providers of content, applications and services by making them unequally accessible (for example, if you have to pay to access some sites/services, but get "free" access to others), this constitutes an

arbitrary interference of users' rights established under Article 3(1) of the Regulation and should be prohibited according to Article 3(2).

Recital 7 of the Regulation defines the types of commercial practices that require national regulators to intervene. However, the language of this recital that "National regulatory and other competent authorities should be empowered to intervene" and "should be required, as part of their monitoring and enforcement function, to intervene" only provides the minimum floor for regulatory intervention and not a maximum ceiling of the scope of this regulation. National Regulatory Authorities have a strict mandate to implement the restriction on harmful commercial practices of Article 3(2) of the Regulation. This means that a slower (and resource-intensive) case-by-case approach is not an appropriate implementation of the legislation.

Application-specific zero-rating (i.e. zero-rating of individual applications or whole classes of applications) and zero-rating for a fee (i.e. where application providers pay to have their data zero-rated) are commercial practices that systematically—regardless of their scale and the market position of the players involved—interfere with the end-users' right of Article 3(1) to impart information, and therefore materially reduce end-users' choice in practice. If people have to pay to access YOUR information and get access to other information for free, this is quite obviously a restriction on the right to distribute information, as described in Recital 1 of the legislation. It is logical, therefore that such practices be banned under the provisions of Article 3(2).

In addition, National Regulatory Authorities have to ensure clarity and predictability of authorised business models in the digital single market to fulfil the goal of this Regulation to “guarantee the continued functioning of the Internet ecosystem as an engine of innovation”. BEREC's mandate pursuant to Article 5(3) of the EU Regulation is to contribute to the "consistent application of this Regulation" by issuing clear rules. A case-by-case approach falls short, since the legality of each zero-rating offer will have to be assessed individually by 31 enforcement bodies and radically different patterns of what is permitted and prohibited in each country will accumulate over time, as a direct result of these case-by-case decisions. This legal uncertainty discourages long-term planning and innovation, and is therefore detrimental to investment in the European start-up economy. Finally, most of the commercial practices highlighted by BEREC have a harmful effect on the fundamental rights of end-users protected under the Charter of Fundamental Rights of the European Union. By making certain services unequally accessible, zero-rating infringes on the media freedom and pluralism (Article 11(2) of the Charter). Zero-rating also constitutes a discrimination against the right to provide services in EU Member states and the freedom to conduct a business for every competitor of the services or applications that are being zero-rated. (see Articles 15(2)), and 16 of the Charter of Fundamental Rights).

[TM#1v2v2]

The EU Regulation has very clear rules on what constitutes reasonable traffic management. According to its Article 3(3), all traffic management should be as application agnostic as possible. Every deviation from this rule, such as class-based traffic management, could harm competition by offering priority to some classes of applications, but not others, for example.

Class-based traffic management also harms applications and services that are misclassified, whether deliberately or not. This is a particular risk for traffic from small businesses or start-ups. Class-based traffic management also risks discriminating against encrypted and anonymised traffic, which could be throttled by ISPs. It also harms users whose needs for accessing a certain class of service differ from the ISPs' assumptions. Finally, the lack of transparency around this practice creates uncertainty about the performance of particular applications in any particular network. As with zero-rating, the complexity and ambiguity of this approach makes it more difficult for regulators to enforce it. Therefore, applying class-based traffic management instead of application agnostic traffic management is unnecessary, disproportionate, discriminatory and hinders transparency.

In light of these harms, paragraphs 54, 55, 57 and 63 of the draft guidelines are not yet fully in line with the EU Regulation. Article 3(3) subparagraph 2 clearly requires traffic management to be transparent, non-discriminatory and proportionate, in order to be deemed reasonable. Those conditions have to be read in the context of Article 3, to distinguish reasonable and unreasonable forms of traffic management measures.

Paragraph 63 of BEREC's draft guidelines interpret "reasonable traffic management" which is inconsistent with the legislator's intentions. The draft guidelines would allow far too broad class-based traffic management measures. These would be based on the functionality of the service and protocol used, but it seems clear from recital 9 and the structure of Article 3(3) of the Regulation that the legislator only intended "reasonable measures" to be based on the Quality of Service requirements of traffic (classes for sensitivity to latency, jitter, packet loss and bandwidth).

According to the proportionality principle and paragraph 58 of the draft guidelines, all forms of user-controlled quality of service and consumption based traffic management should be applied and exhausted before more intrusive measures are taken. Therefore, BEREC should bring paragraphs 54, 55, 57 and 63 more clearly into line with the EU Regulation.

Transparency cannot, as proposed by the Commission in its initial draft of the Regulation and subsequently

rejected, be considered an antidote to anti-competitive behaviour in itself. Transparency has limited scope in fixing problems, particularly in this context.

Please treat this comment confidentially and don't publish it.
