Hello,

I want to ask you to define point A (i.e. between wall and modem) as the Network Termination Point. From my point of few that's the one that makes most sense and gives users (and not service providers) the necessary freedoms.

While B or C might be cheaper on first glance for internet users, I'm convinced this comes at a cost -- for security, privacy and also competition on the market of routers/modems.

Given that the technologies are defined standards there should be no or little problems with problematic devices (assuming that the ISPs in fact also conform to the respective standards and not only enough to make a handful of devices work).

Thanks
[REDACTED], Germany
